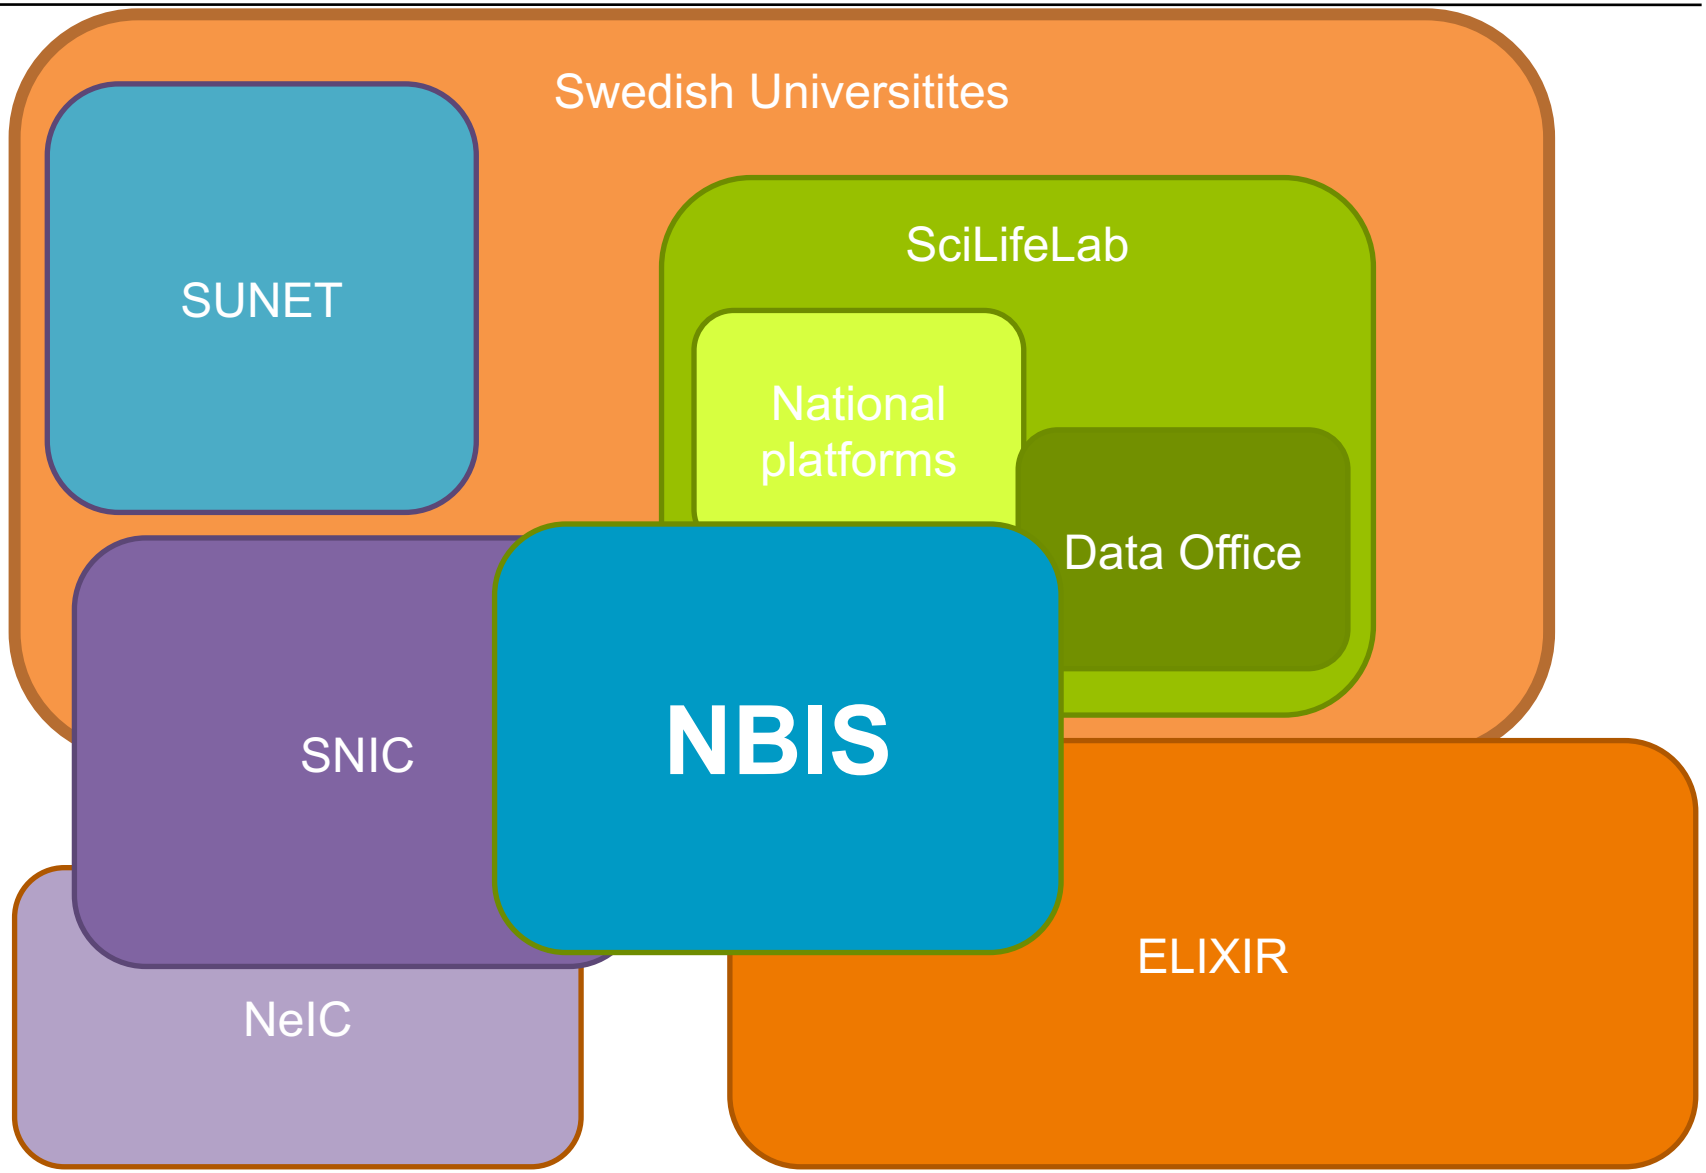
Managing your data

Niclas Jareborg, NBIS
niclas.jareborg@nbis.se

Introduction to NGS course

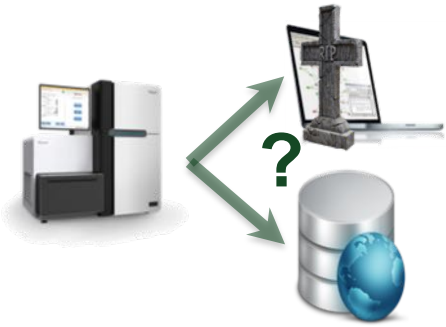
Research infrastructure landscape

Organizational mayhem



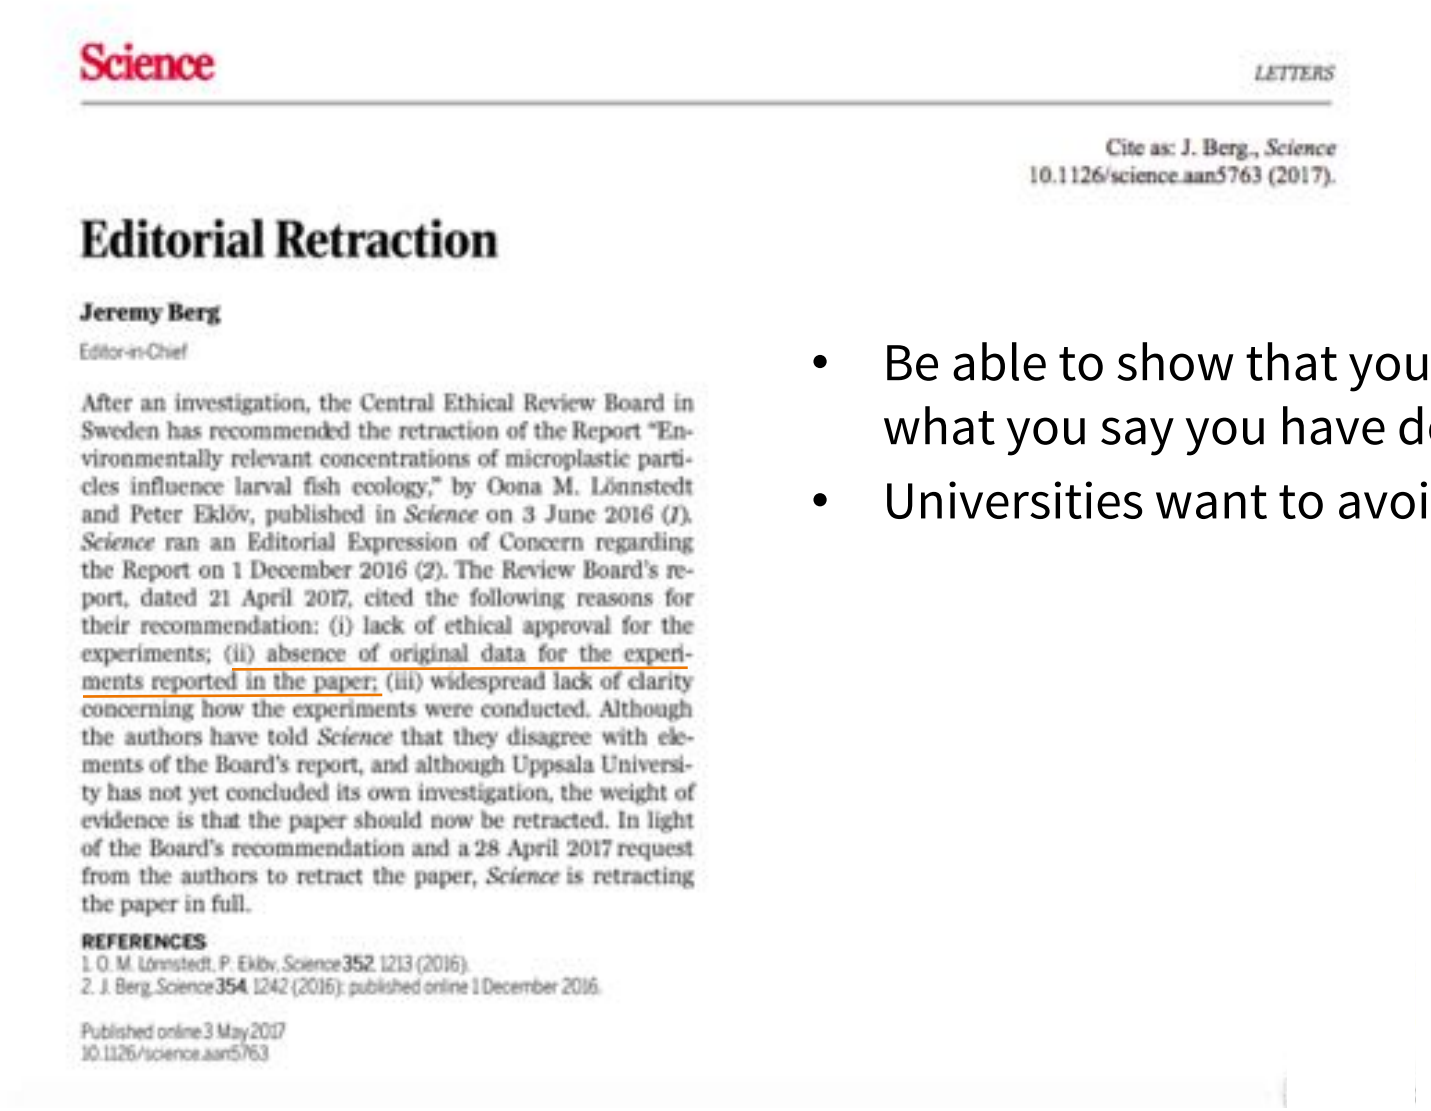
Why manage research data?

- To make your research easier!
- To stop yourself drowning in irrelevant stuff
- In case you need the data later
- To avoid accusations of fraud or bad science
- To share your data for others to use and learn from
- To get credit for producing it
- Because funders or your organisation require it



Well-managed data opens up opportunities for re-use, integration and new science

Accusation of fraud



Science

Editorial Retraction

Jeremy Berg
Editor-in-Chief

After an investigation, the Central Ethical Review Board in Sweden has recommended the retraction of the Report "Environmentally relevant concentrations of microplastic particles influence larval fish ecology," by Oona M. Lönnstedt and Peter Eklöv, published in *Science* on 3 June 2016 (*1*). *Science* ran an Editorial Expression of Concern regarding the Report on 1 December 2016 (*2*). The Review Board's report, dated 21 April 2017, cited the following reasons for their recommendation: (i) lack of ethical approval for the experiments; (ii) absence of original data for the experiments reported in the paper; (iii) widespread lack of clarity concerning how the experiments were conducted. Although the authors have told *Science* that they disagree with elements of the Board's report, and although Uppsala University has not yet concluded its own investigation, the weight of evidence is that the paper should now be retracted. In light of the Board's recommendation and a 28 April 2017 request from the authors to retract the paper, *Science* is retracting the paper in full.

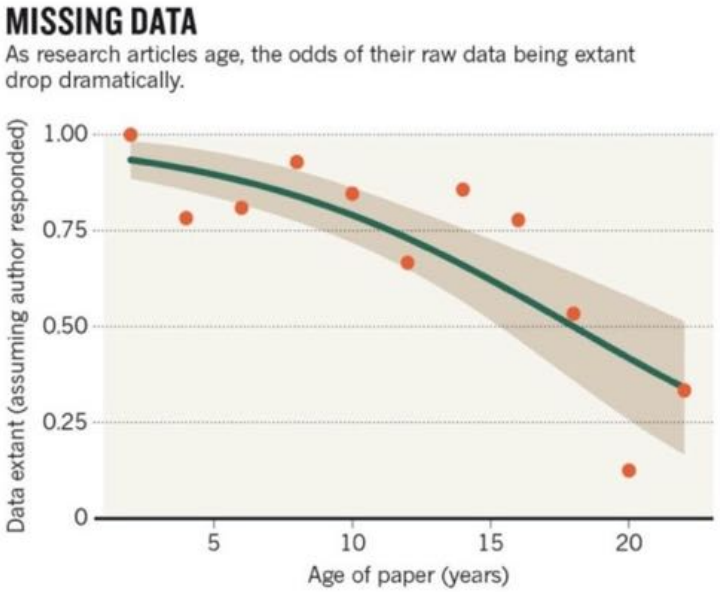
Open Access to research data

- *The practice of providing **on-line access** to scientific information that is **free of charge** to the end-user and that is **re-usable**.*
  - Not necessarily unrestricted access, e.g. for sensitive personal data
    - *"As open as possible, as closed as necessary"*
- Strong international movement towards Open Access (OA)
- European Commission recommended the member states to establish national guidelines for OA
  - Swedish Research Council (VR) submitted proposal to the government Jan 2015
- Research bill 2017–2020 – *28 Nov 2016*
  - "*The aim of the government is that all scientific publications that are the result of publicly funded research should be openly accessible as soon as they are published. Likewise, **research data** underlying scientific publications should be **openly accessible** at the time of publication.*" [my translation]
- 2018 – VR assigned by the government to coordinate national efforts to implement open access to research data

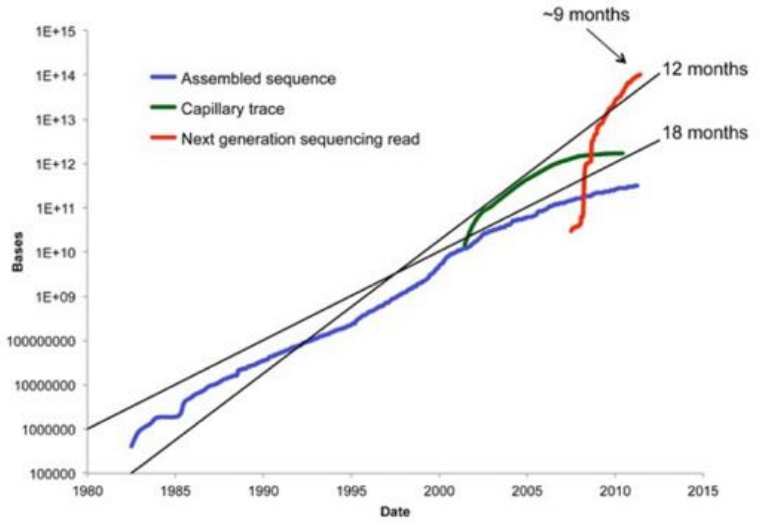
Why *Open Access*?

- Democracy and transparency
  - Publicly funded research data should be accessible to all
  - Published results and conclusions should be possible to check by others
- Research
  - Enables others to combine data, address new questions, and develop new analytical methods
  - Reduce duplication and waste
- Innovation and utilization outside research
  - Public authorities, companies, and private persons outside research can make use of the data
- Citation
  - Citation of data will be a merit for the researcher that produced it

Data loss is real and significant, while data growth is staggering



Nature news, 19 December 2013



- DNA sequence data is doubling every 6-8 months and looks to continue for this decade
- Projected to surpass astronomy data in the coming decade

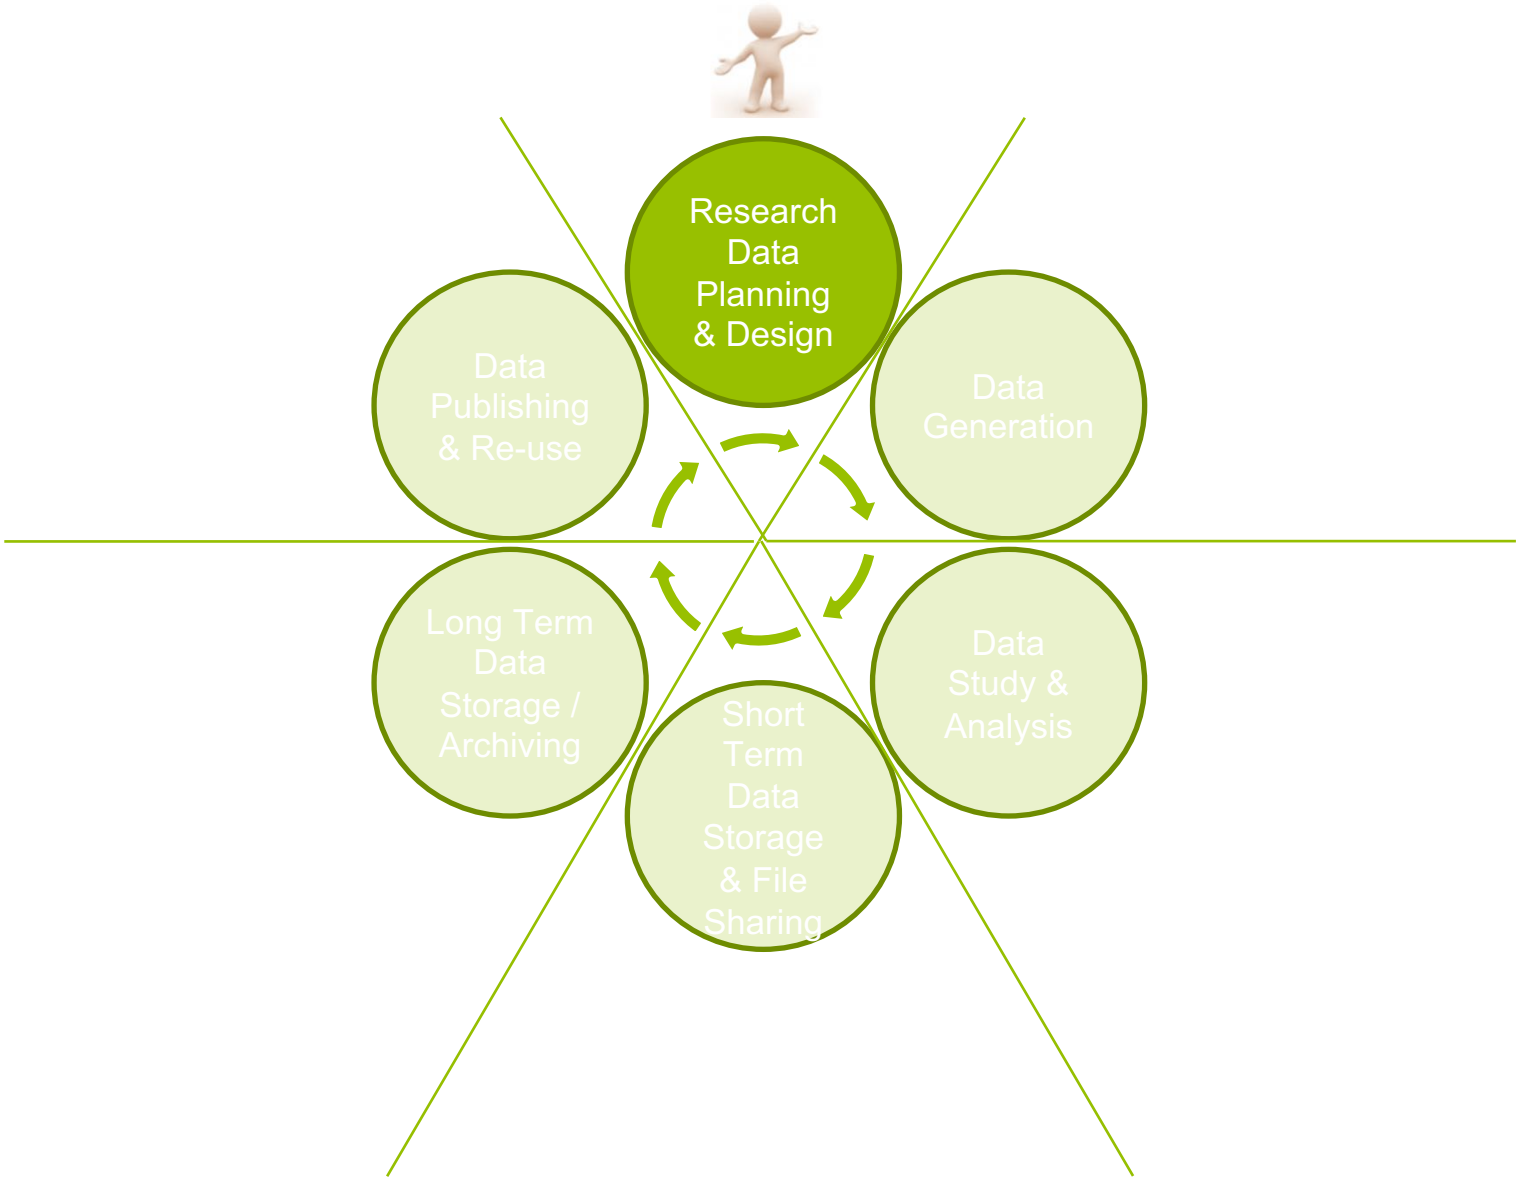
The Research Data Life Cycle

Planning & Design



Planning & Design

- Data Management planning
  - What data & information will I need to answer my research questions?
  - How can I keep track of that data and information during the project, and beyond?
  - ➔ *Data Management Plans*

Data Management Plans

Will become a standard part of the research funding application process

- **Data collection** - data types and volumes, analysis code
- **Data organization** - folder and file structure, and naming
- **Data documentation** - data and analysis, metadata standards
- **Data storage** - storage/backup/protection & time lines
- **Data policies** - conditions/licences for using data & legal/ethical issues
- **Data sharing** - *When* and *How* will *What* data (and code) be shared
- **Roles and responsibilities** - who's responsible for what & is competence available
- **Budget** - People & Hardware/Software

Dunning-Kruger effect

A cognitive bias in which relatively unskilled persons suffer illusory superiority, mistakenly assessing their ability to be much higher than it really is.

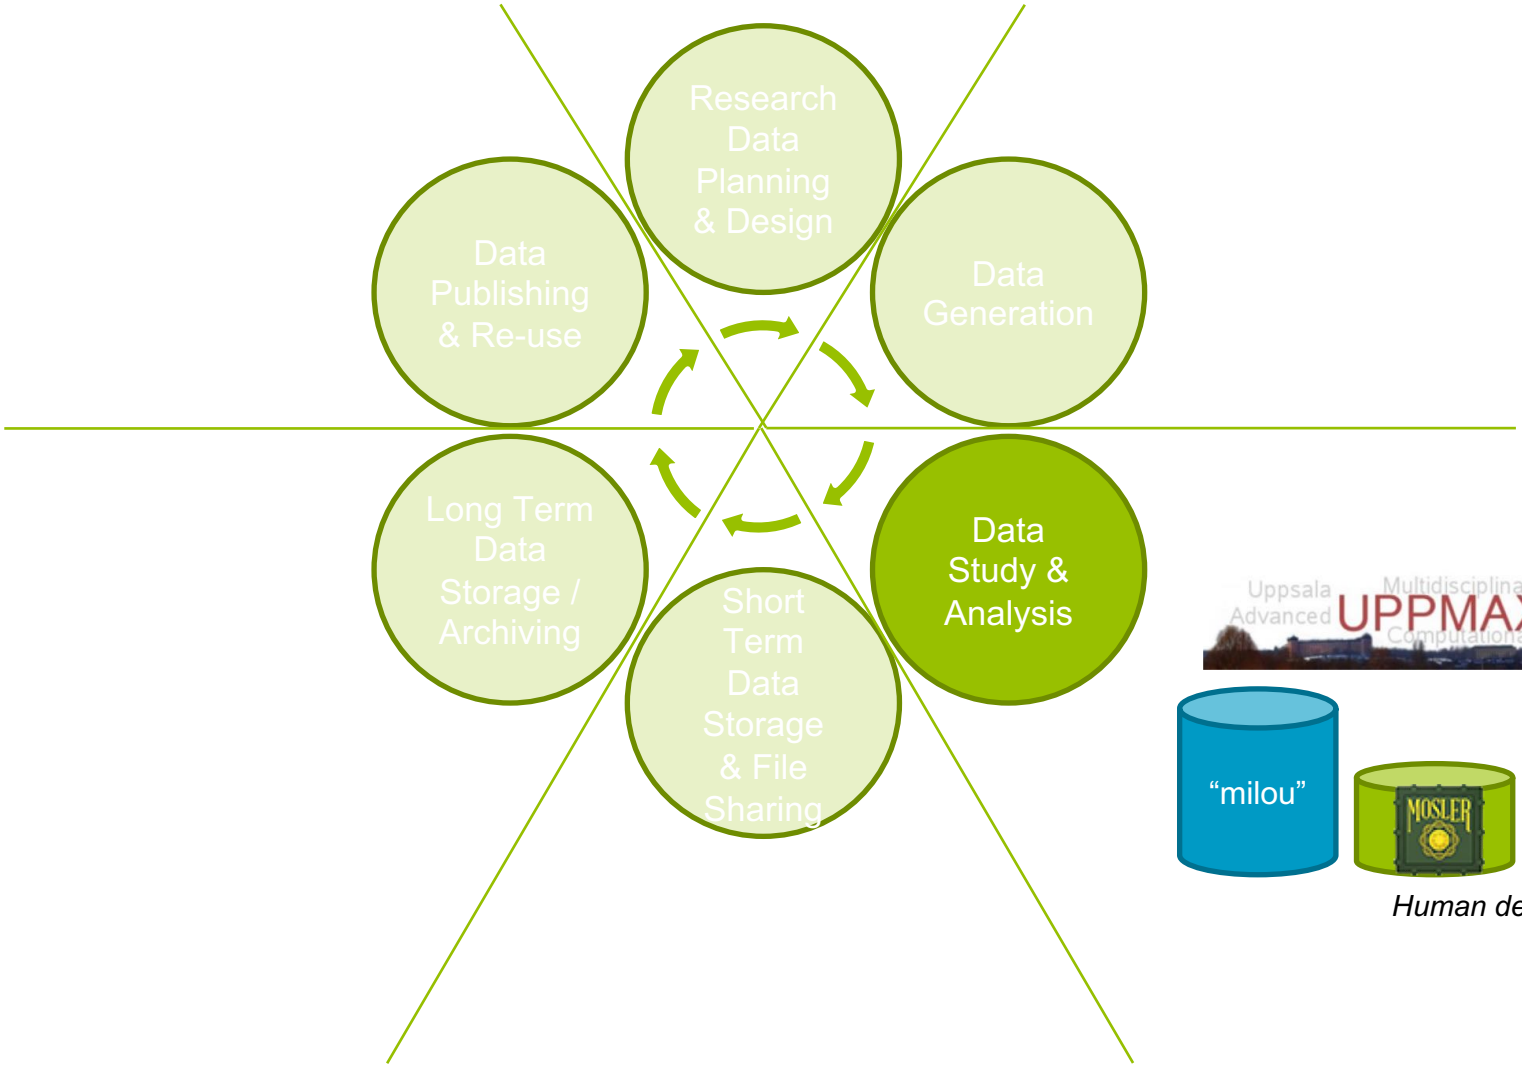
Study & Analysis

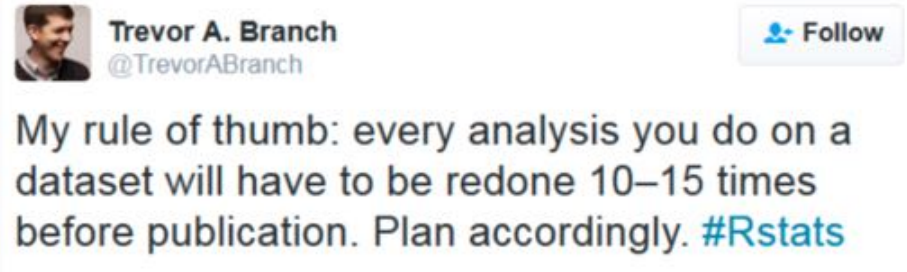


Human derived data

Structuring data for analysis

- Guiding principle
  - *“Someone unfamiliar with your project should be able to look at your computer files and understand in detail what you did and why.”*

- Research reality
  - *"Everything you do, you will have to do over and over again”*
    – Murphy’s law

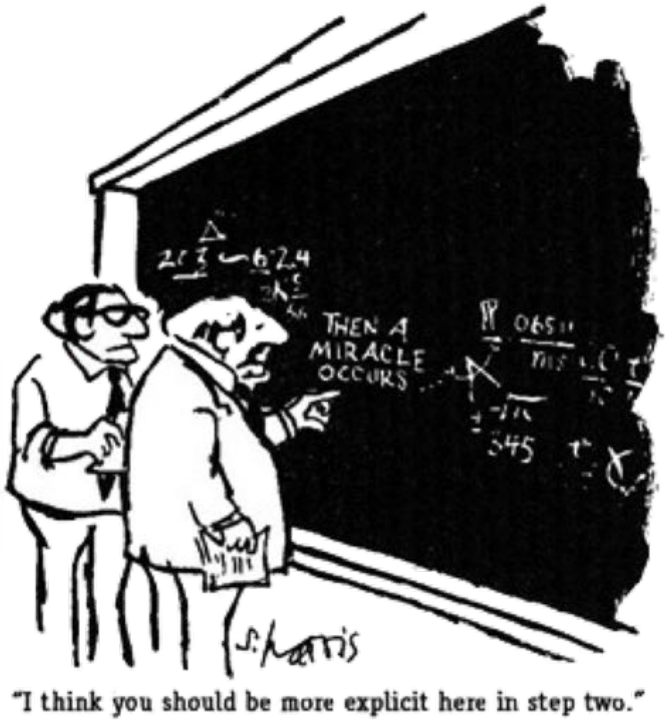


Structuring data for analysis

- Poor organizational choices lead to significantly slower research progress

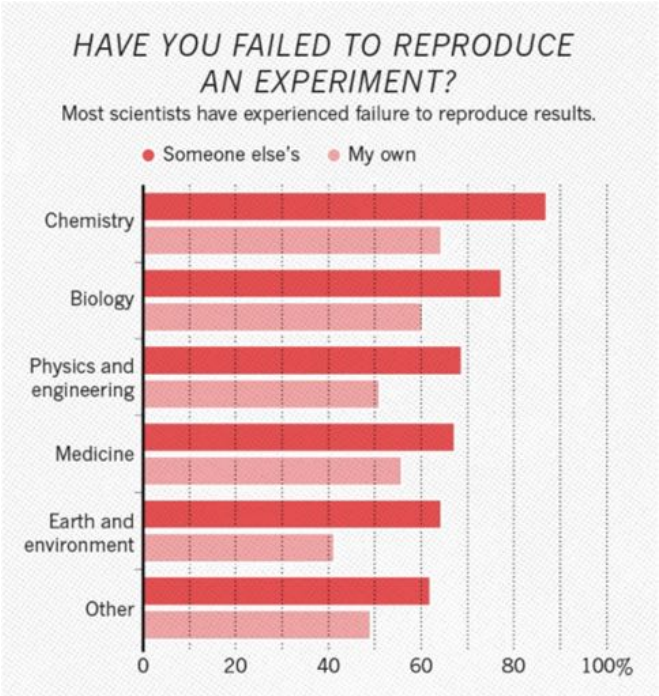
  "Your primary collaborator is yourself six months from now, and your past self doesn't answer e-mails."

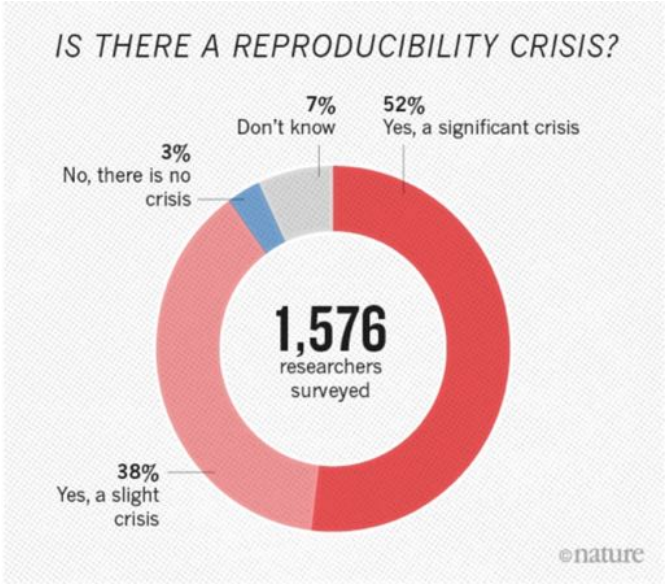
- It is critical to make results reproducible



"I think you should be more explicit here in step two."

A reproducibility crisis





A recent survey in Nature revealed that irreproducible experiments are a problem across all domains of science[1].

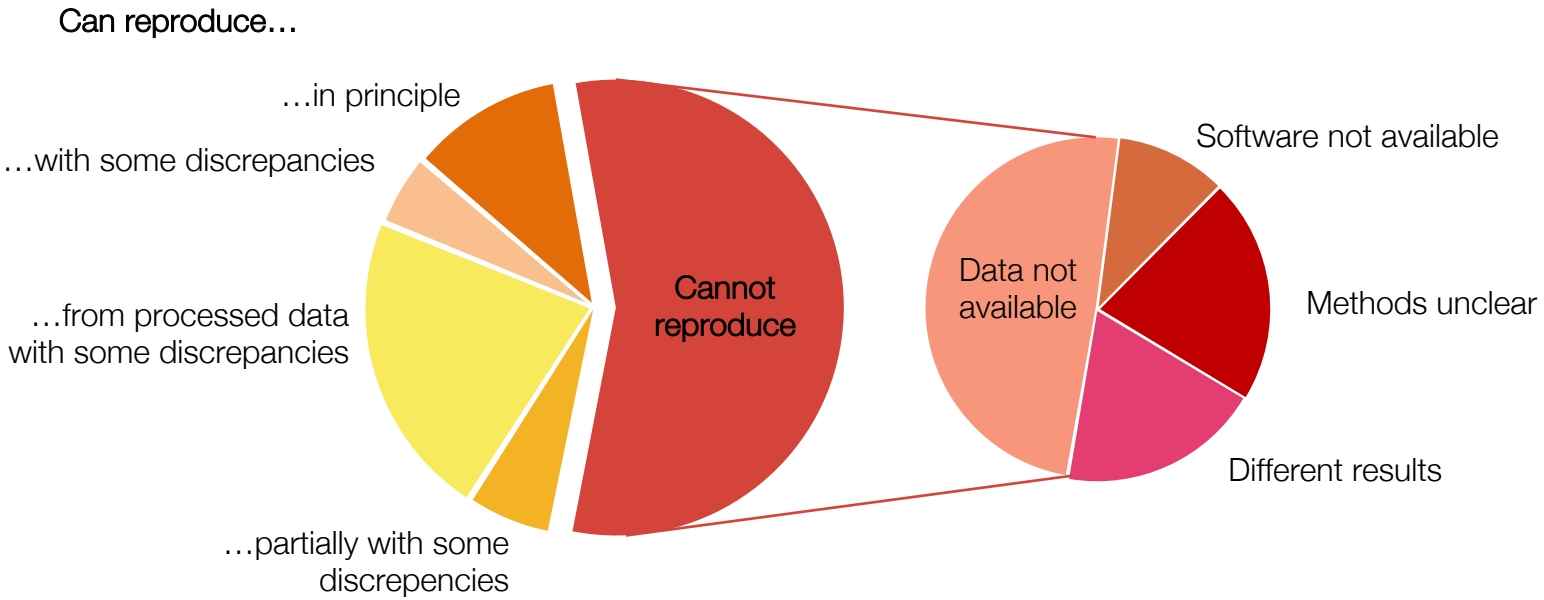
Medicine is among the most affected research fields. A study in Nature found that 47 out of 53 medical research papers focused on cancer research were irreproducible[2].

Common features were failure to show all the data and inappropriate use of statistical tests.

[1] "1,500 scientists lift the lid on reproducibility". Nature. 533: 452–454
[2] Begley, C. G.; Ellis, L. M. (2012). "Drug development: Raise standards for preclinical cancer research". Nature. 483 (7391): 531–533.

A reproducibility crisis

Reproduction of data analyses in 18 articles on microarray-based gene expression profiling published in Nature Genetics in 2005–2006:



Summary of the efforts to replicate the published analyses.
Adopted from: Ioannidis et al. Repeatability of published microarray gene expression analyses. *Nature Genetics* **41** (2009) doi:10.1038/ng.295

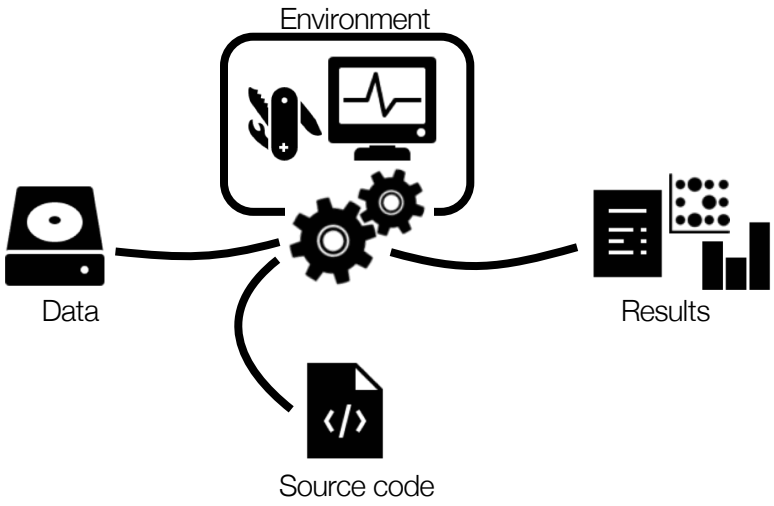
What do we mean by reproducible research?

		Data: Same	Data: Different
Code	Same	Reproducible	Replicable
Code	Different	Robust	Generalizable

Is it really any point doing this?

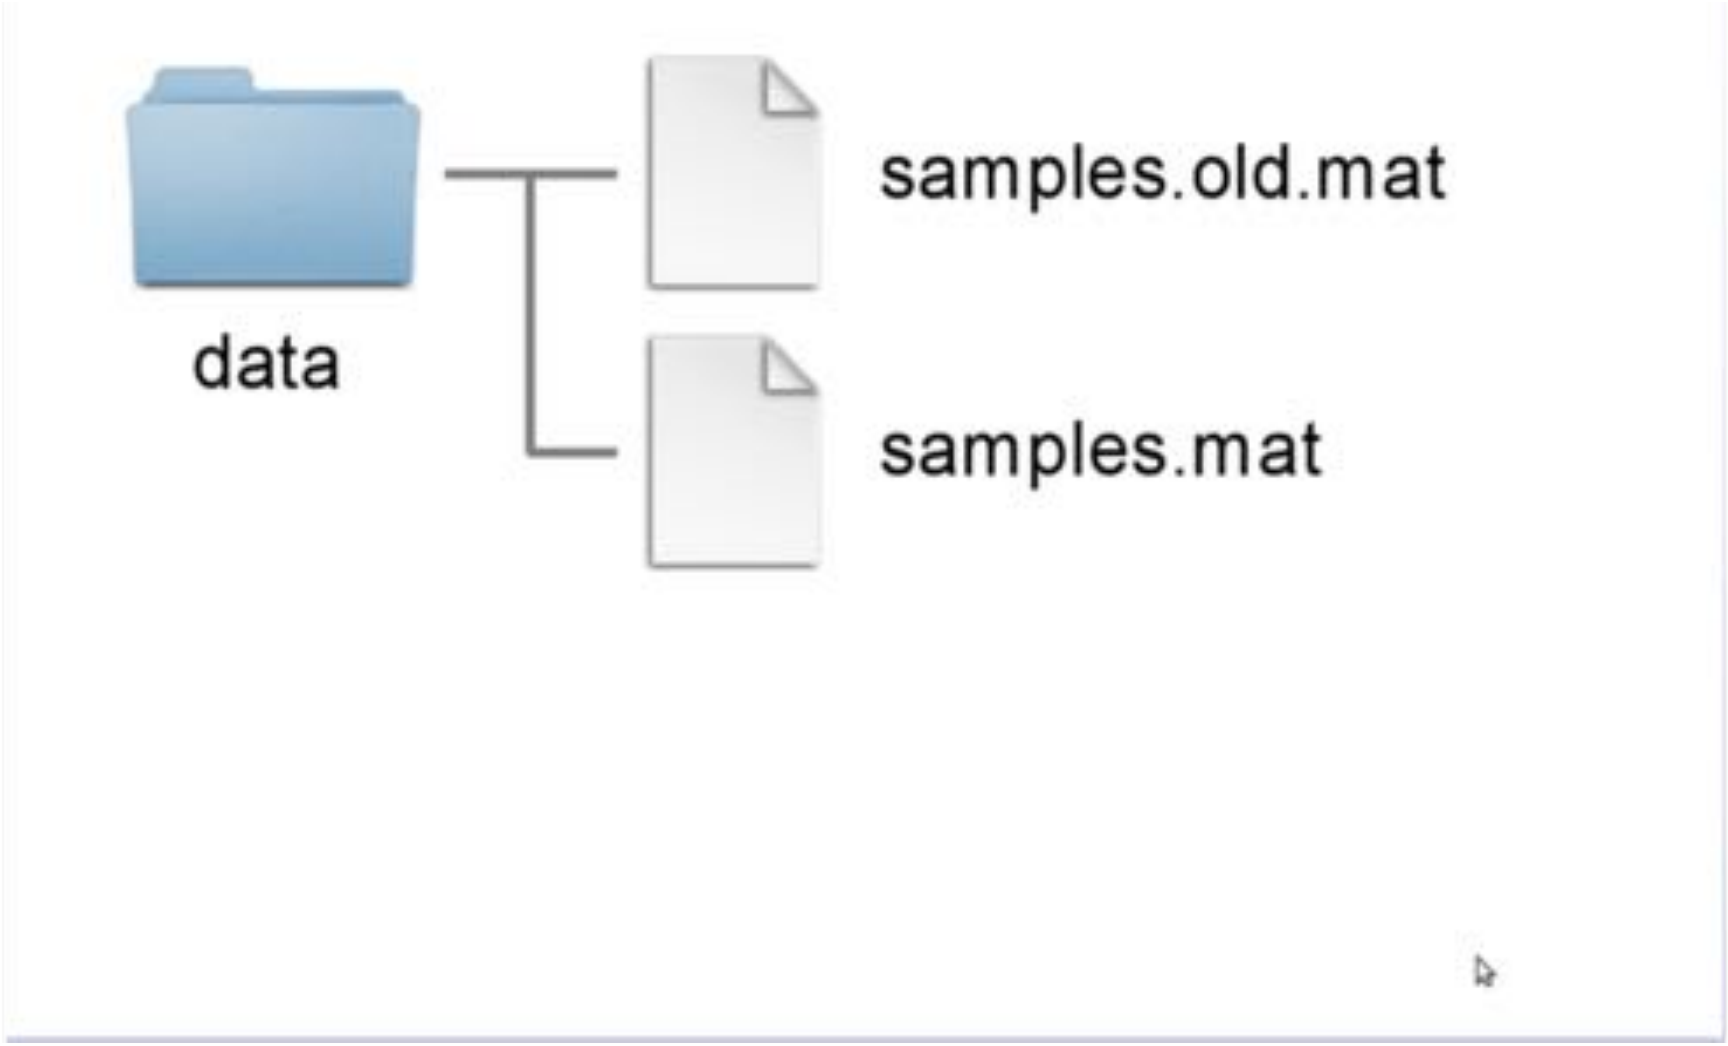
- Primarily for ones own benefit! Organized, efficient, in control. Dynamic team members.
- Transparent what has been done
- Some will be interested in parts of the analysis. Make it easy to redo, then adapt to own data.

All parts of a bioinformatics analysis have to be reproducible:

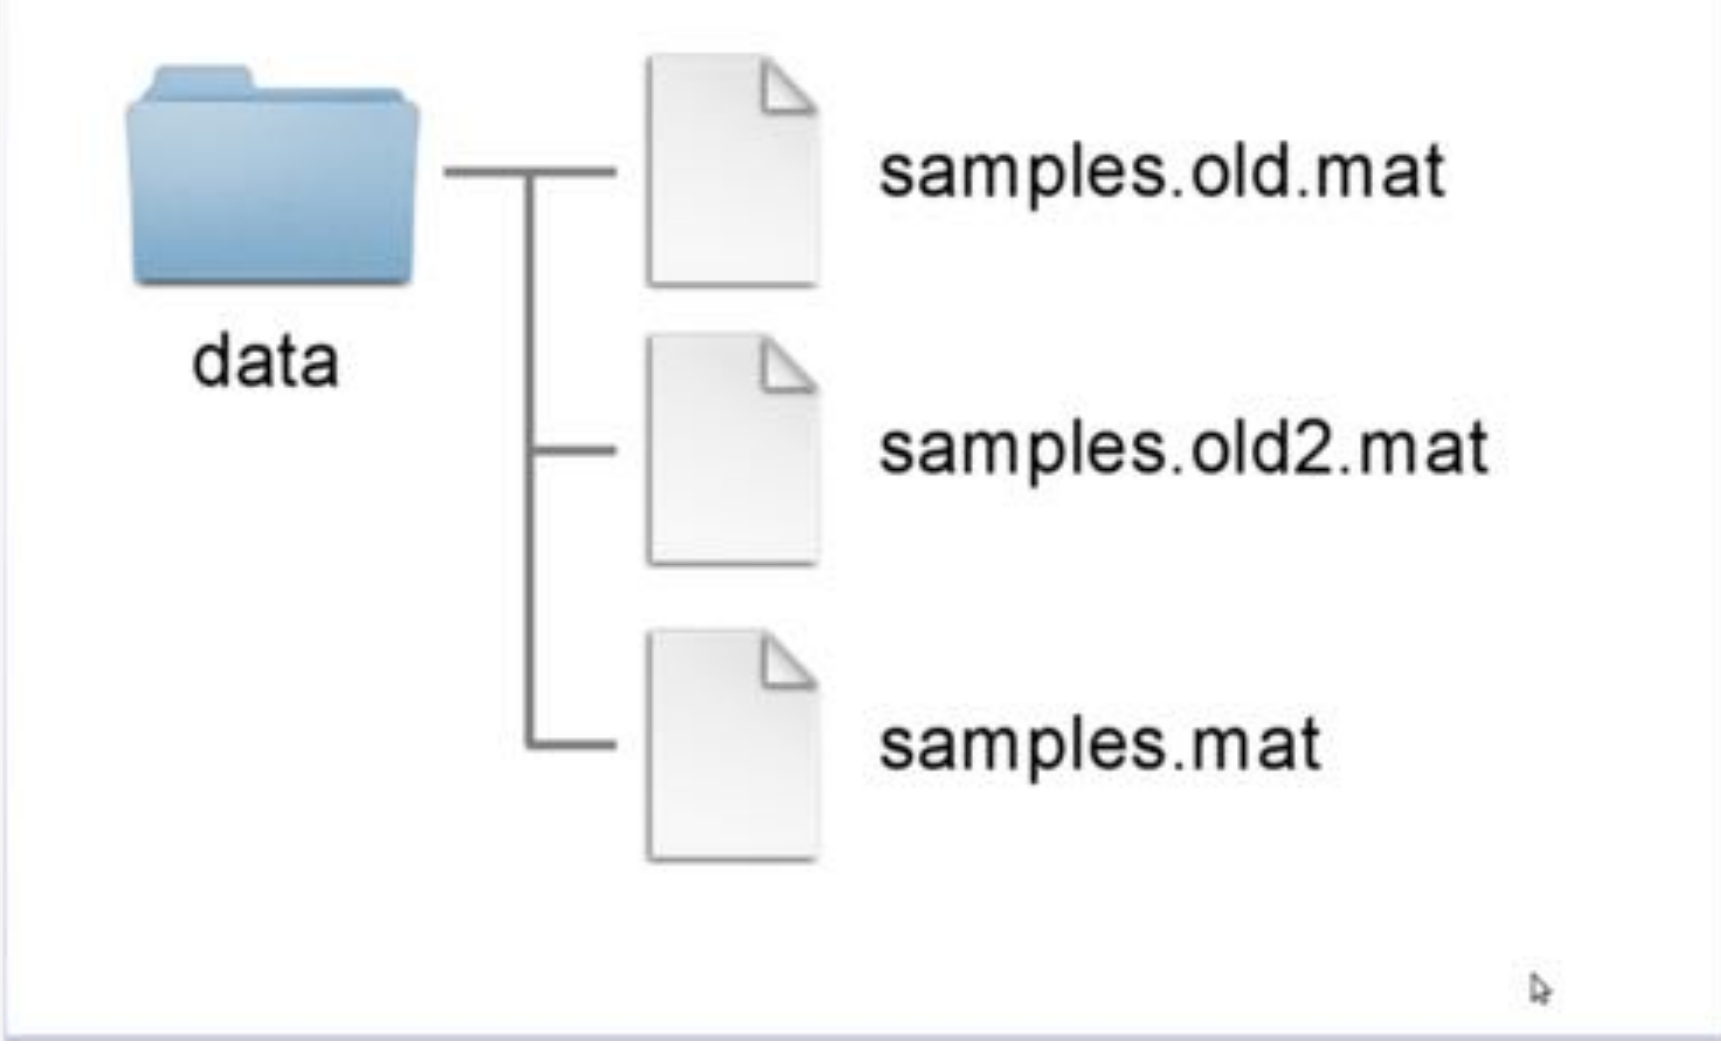


First step - Organization

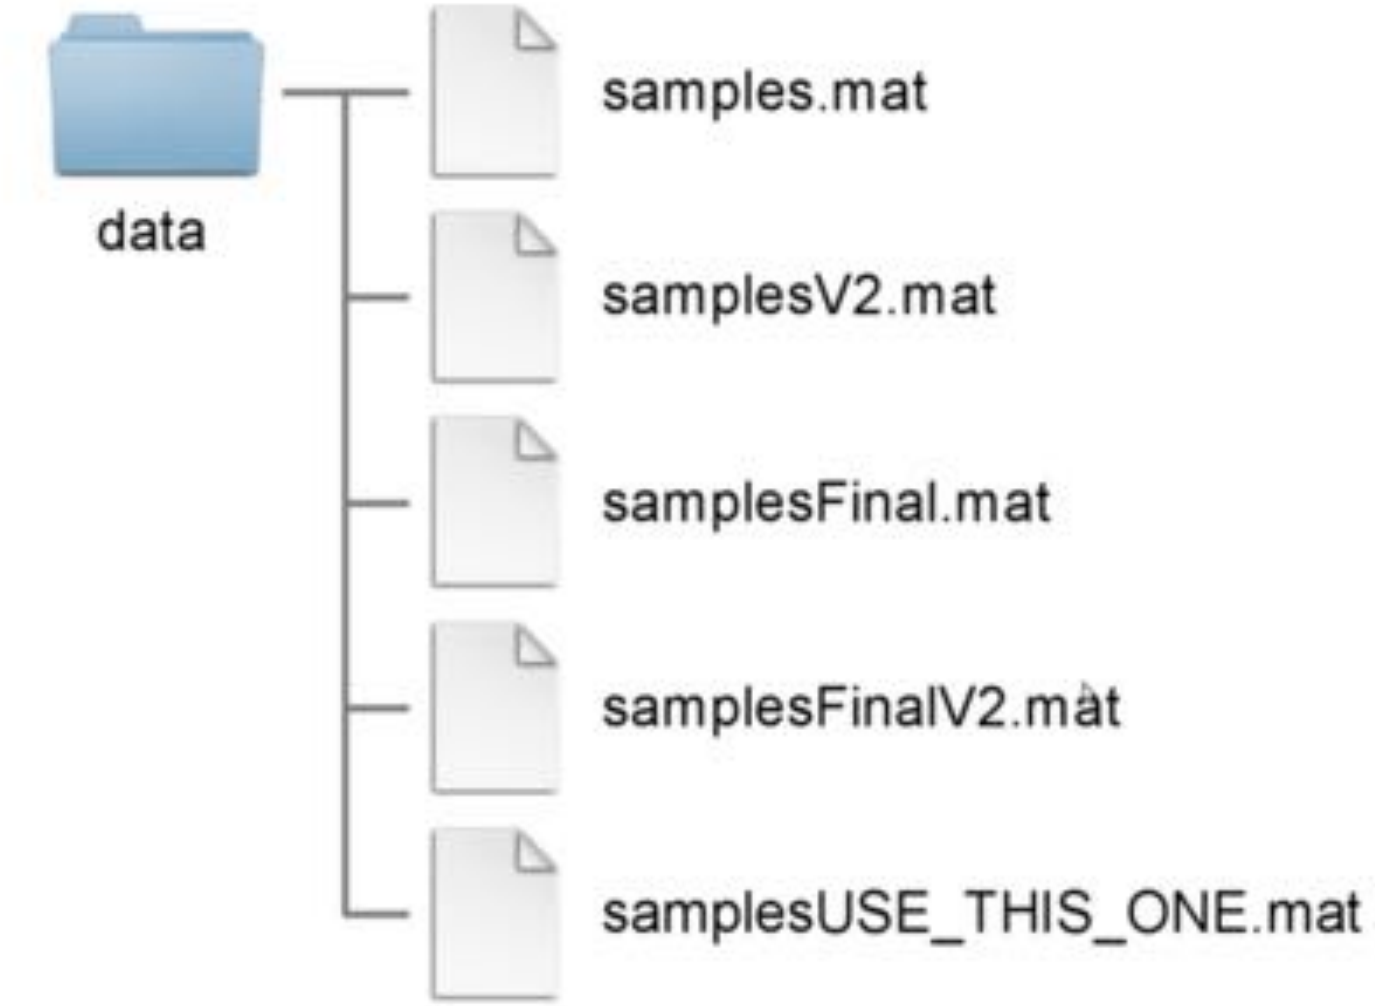
Now what?



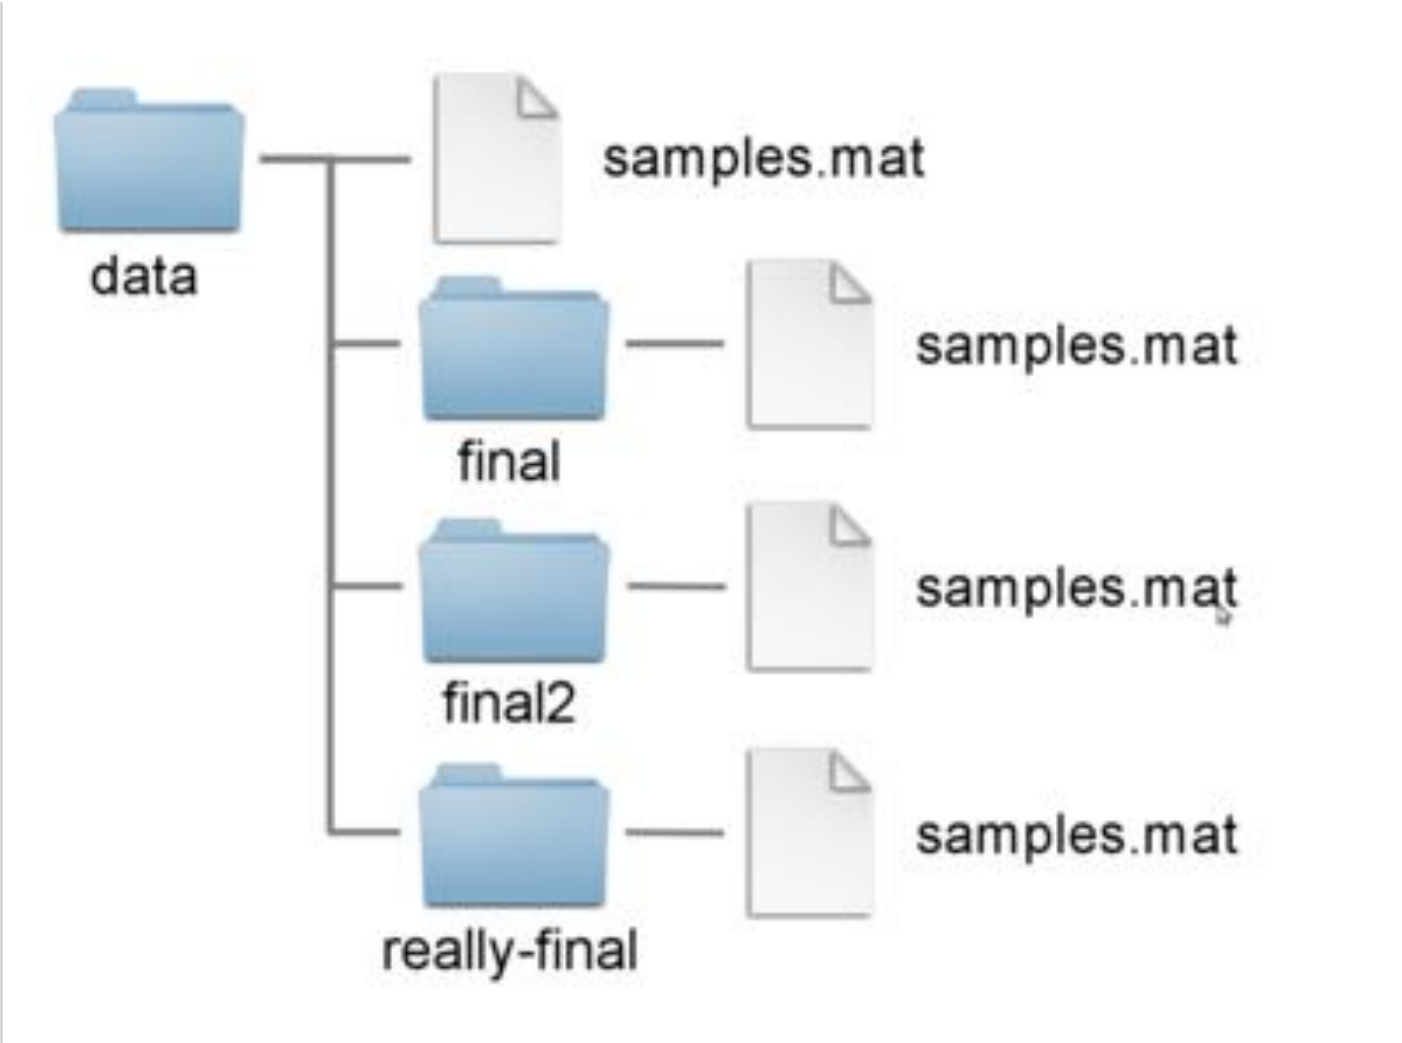
I guess this is alright



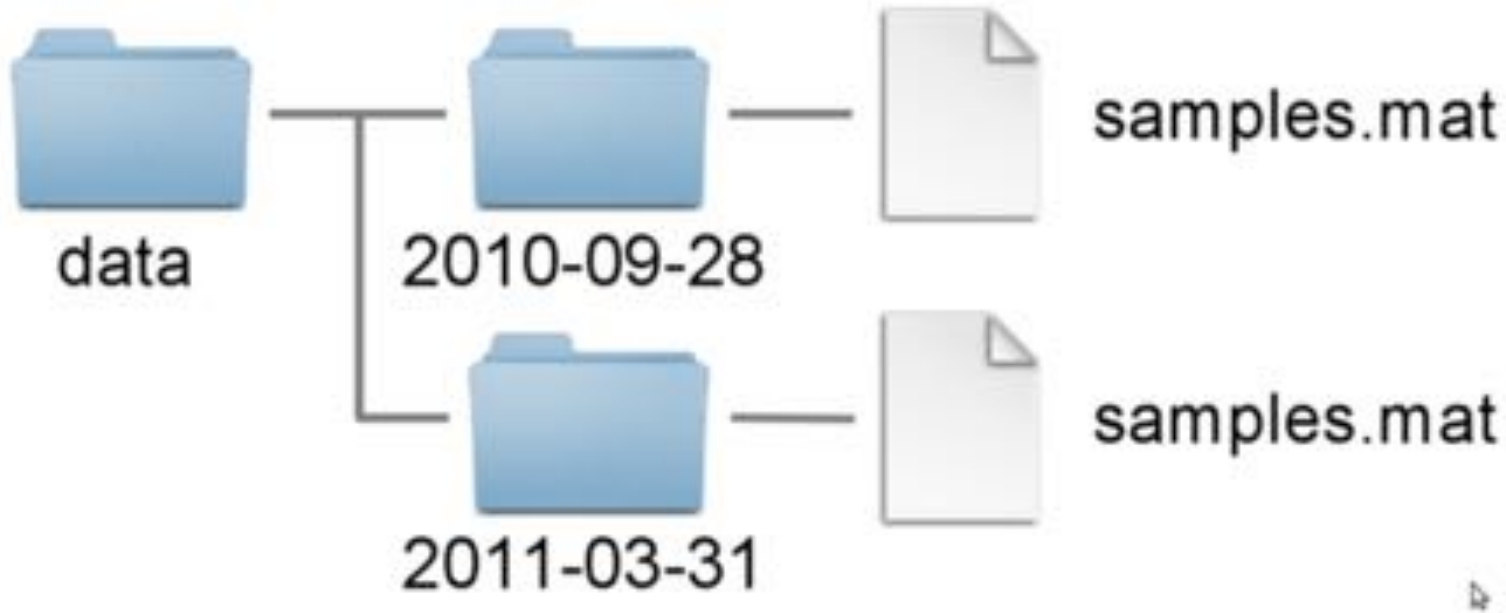
Which one is the most recent?



Another (bad) common approach



A possible solution

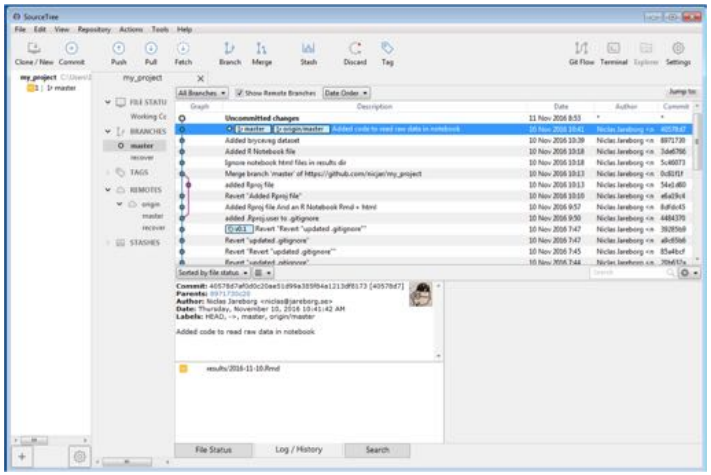


Suggested best practices

- There is a **folder for the raw data**, which do not get altered, or intermixed with data that is the result of manual or programmatic manipulation. I.e., derived data is kept separate from raw data, and **raw data are not duplicated**.
- **Code is kept separate from data**.
- Use a **version control system** (at least for code) – e.g. **git**
- There is a **scratch directory for experimentation**. Everything in the scratch directory can be deleted at any time without negative impact.
- There should be a **README in every directory**, describing the purpose of the directory and its contents.
- Use **non-proprietary formats** – *.csv* rather than *.xlsx*
- Etc…

Version control

- What is it?
  - A system that keeps records of your changes
  - Allows for collaborative development
  - Allows you to know who made what changes and when
  - Allows you to revert any changes and go back to a previous state
- Several systems available
  - git, RCS, CVS, SVN, Perforce, Mercurial, Bazaar
  - git
    - Command line & GUIs
    - Remote repository hosting
      - GitHub, Bitbucket, etc



Suggested best practices

- There is a **folder for the raw data**, which do not get altered, or intermixed with data that is the result of manual or programmatic manipulation. I.e., derived data is kept separate from raw data, and **raw data are not duplicated**.
- **Code is kept separate from data**.
- Use a **version control system** (at least for code) – e.g. **git**
- There is a **scratch directory for experimentation**. Everything in the scratch directory can be deleted at any time without negative impact.
- There should be a **README in every directory**, describing the purpose of the directory and its contents.
- Use **non-proprietary formats** – *.csv* rather than *.xlsx*
- Etc…

Non-proprietary formats

- A text-based format is more future-safe, than a proprietary binary format by a commercial vendor
- ***Markdown*** is a nice way of getting nice output from text.
  - Simple & readable formating
  - Can be converted to lots of different outputs
    - HTML, pdf, MS Word, slides etc

- *Never, never, never use **Excel** for scientific **analysis**!*
  - Script your analysis – bash, python, R, …

Directory structure for a sample project

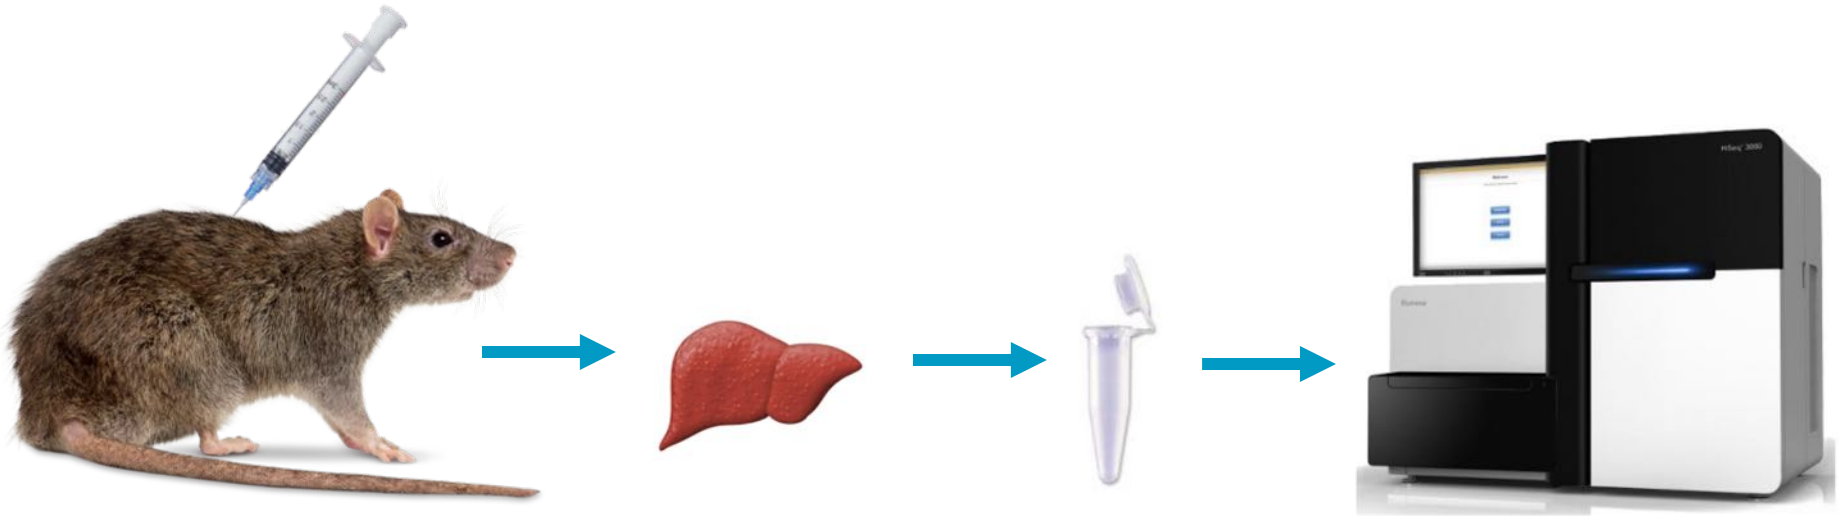
Still missing something

- Need context → document **metadata**
  - From what was the data generated?
  - How do the samples differ?
  - What where the experimental conditions?
  - Etc



Metadata

- Standards
  - Controlled vocabularies / Ontologies
    - Agreed terms for different phenomena

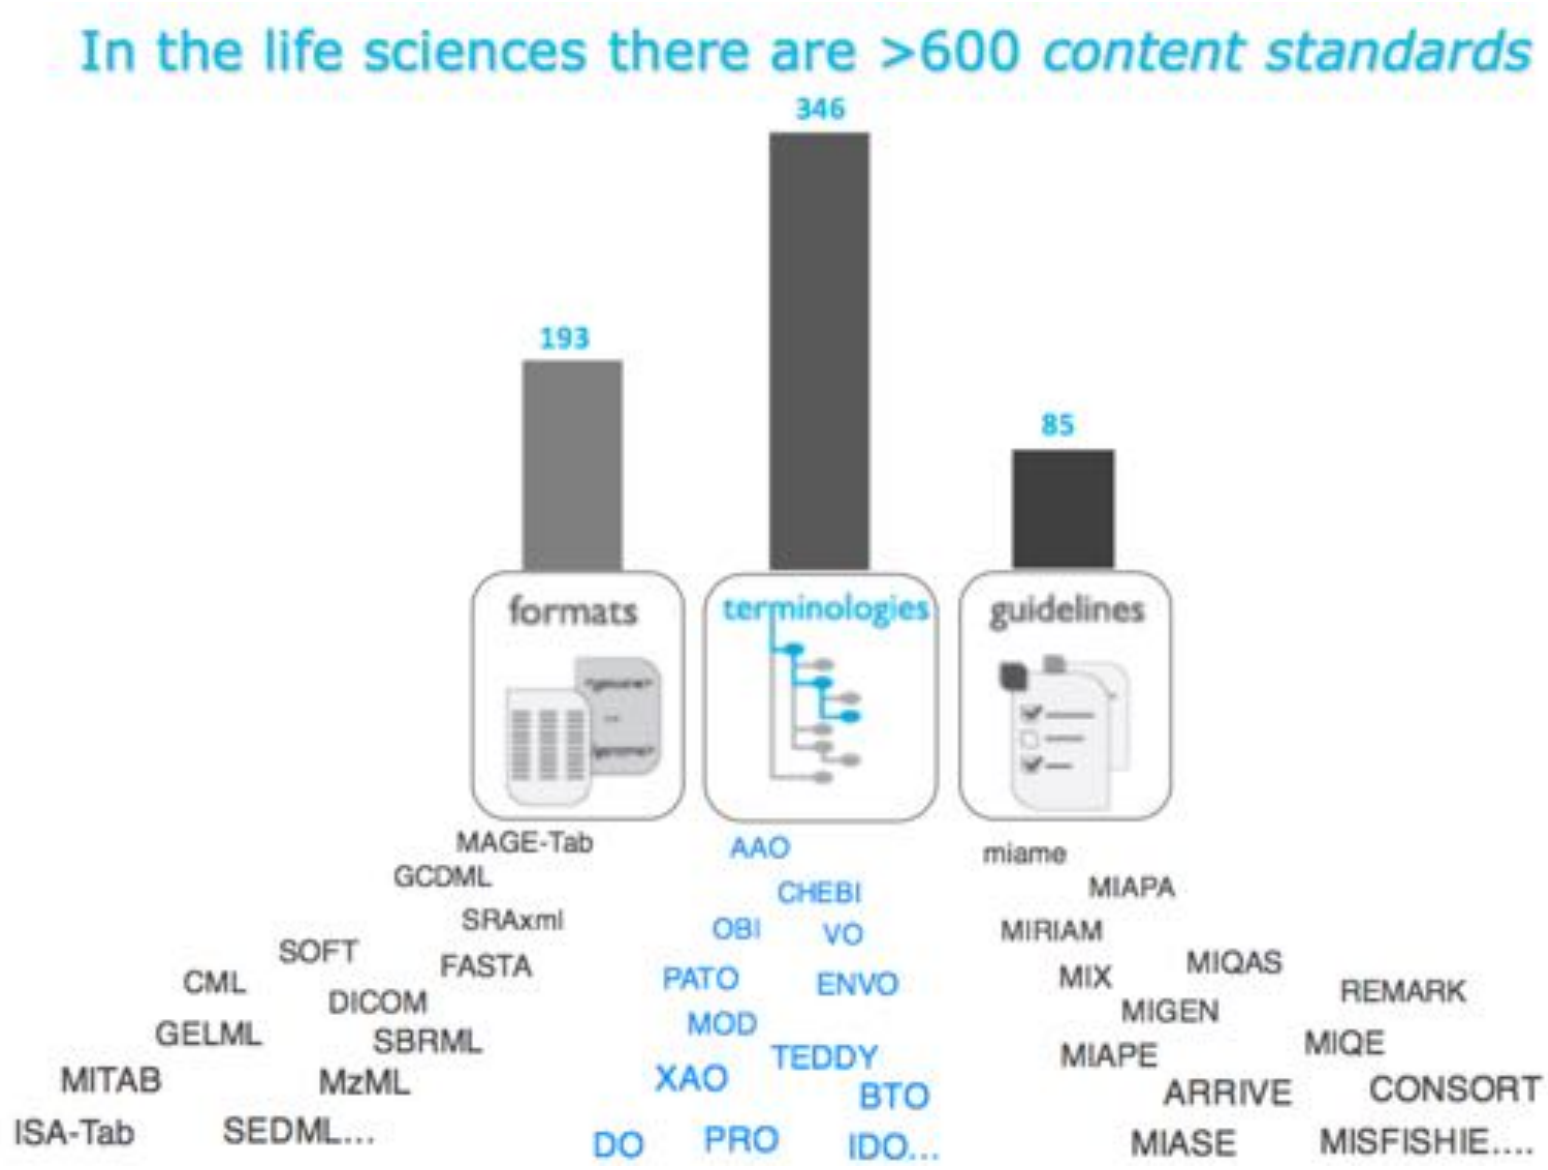
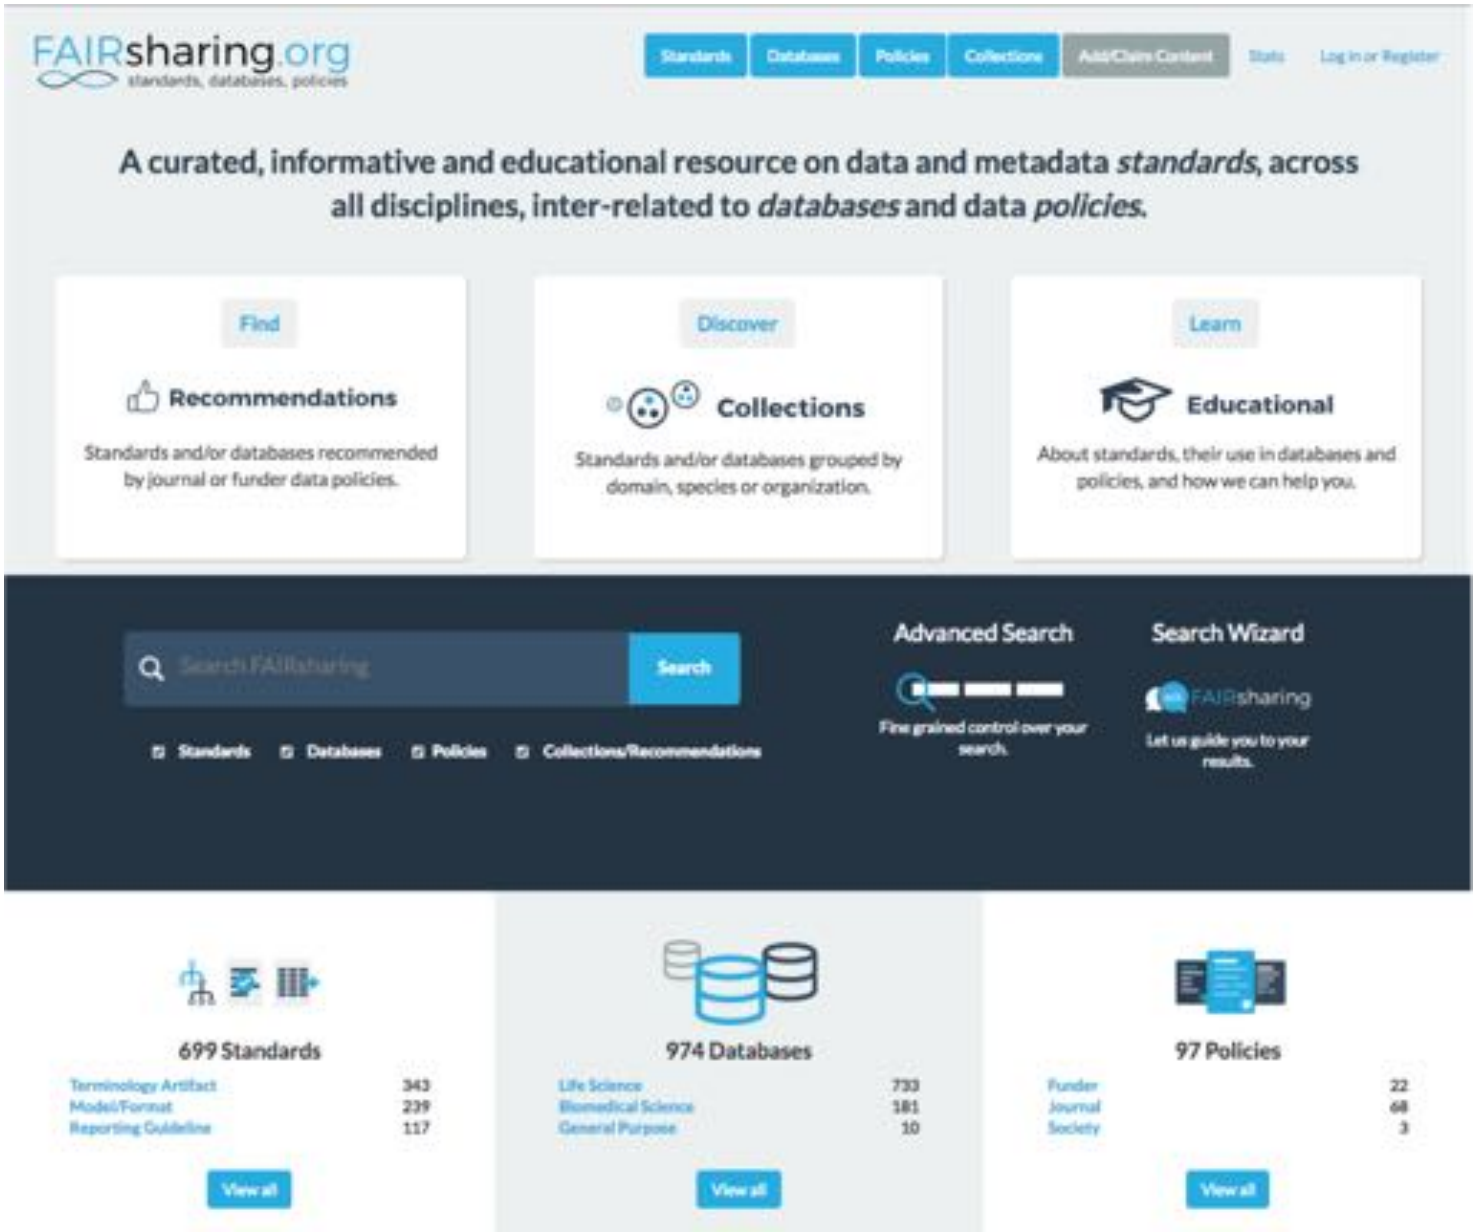
FAIRsharing.org

SciLifeLab



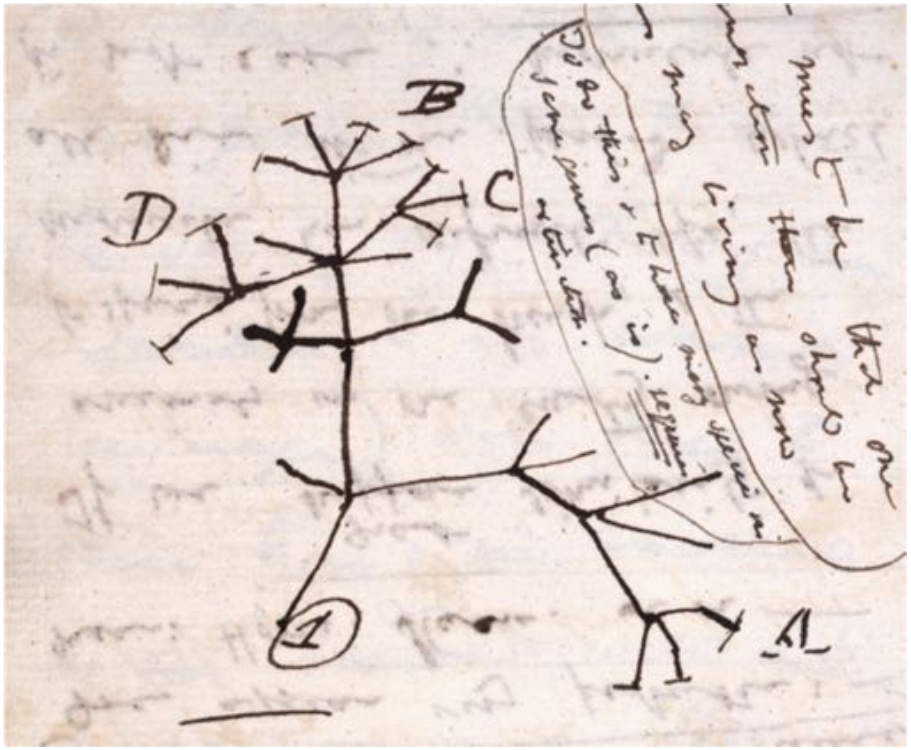
FAIRsharing.org

(was biosharing.org)



Lab notebooks

- Why?
  - You have to understand what you have done
  - **Others should be able to reproduce what you have done**

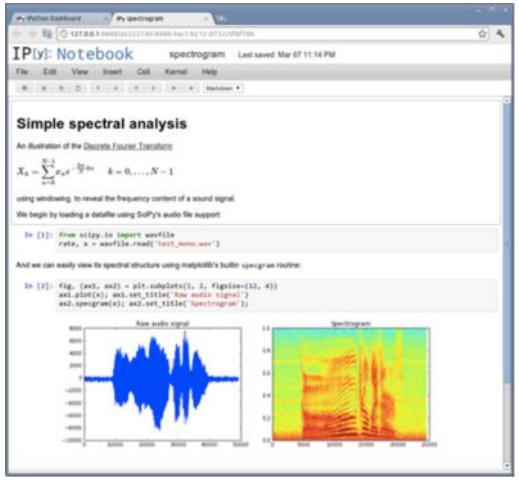


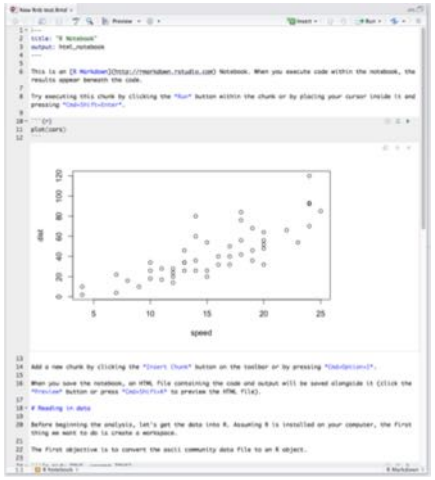
Lab notes – useful practices

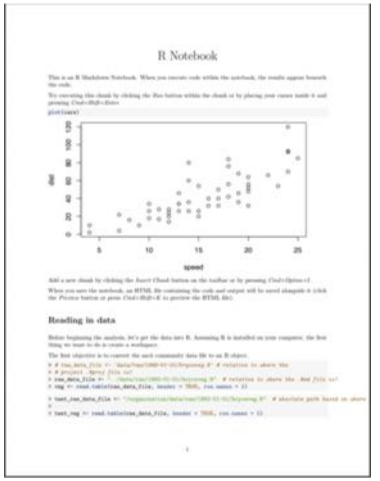
- Put in *results* directory
- *Dated* entries
- Entries relatively verbose
- Link to *data* and *code* (including versions)
    - Point to commands run and results generated
- Embedded images or tables showing results of analysis done
- Observations, Conclusions, and *ideas* for future work
- Also document analysis that *doesn't* work, so that it can be understood why you choose a particular way of doing the analysis in the end

Where to take down notes

- Paper Notebook
- Word processor program / Text files
- Electronic Lab Notebooks
- 'Interactive' Electronic Notebooks
  - e.g. jupyther, R Notebooks in RStudio
  - Plain text - work well with version control (Markdown)
  - Embed and execute code
  - Convert to other output formats
    - html, pdf, word







R Markdown

- R Markdown makes your analysis more reproducible by connecting your code, figures and descriptive text.
- You can use it to make reproducible reports, rather than e.g. copy-pasting figures into a Word document.
- You can also use it as a notebook, in the same way as lab notebooks are used in a wet lab setting

```

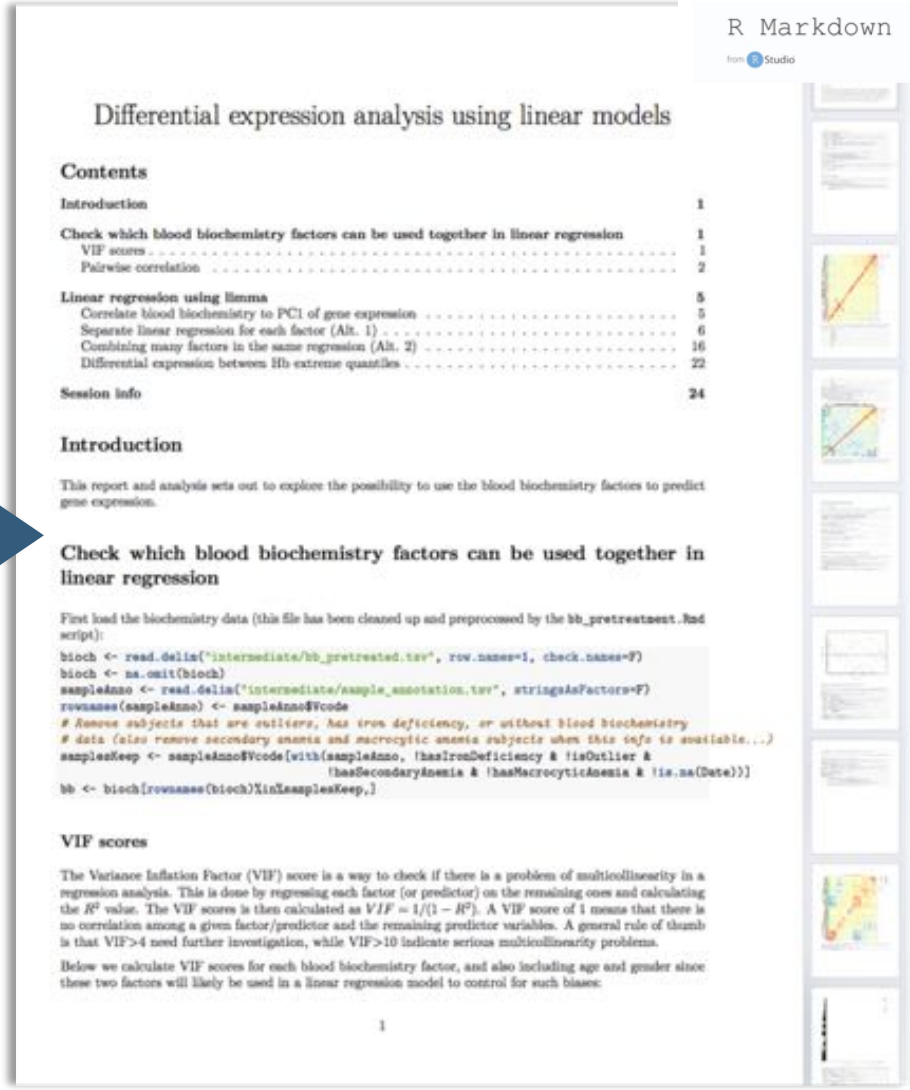
source("source/rmarkdown_functions.R")
```

Introduction
This report and analysis sets out to explore the possibility to use the blood biochemistry
factors to predict gene expression.

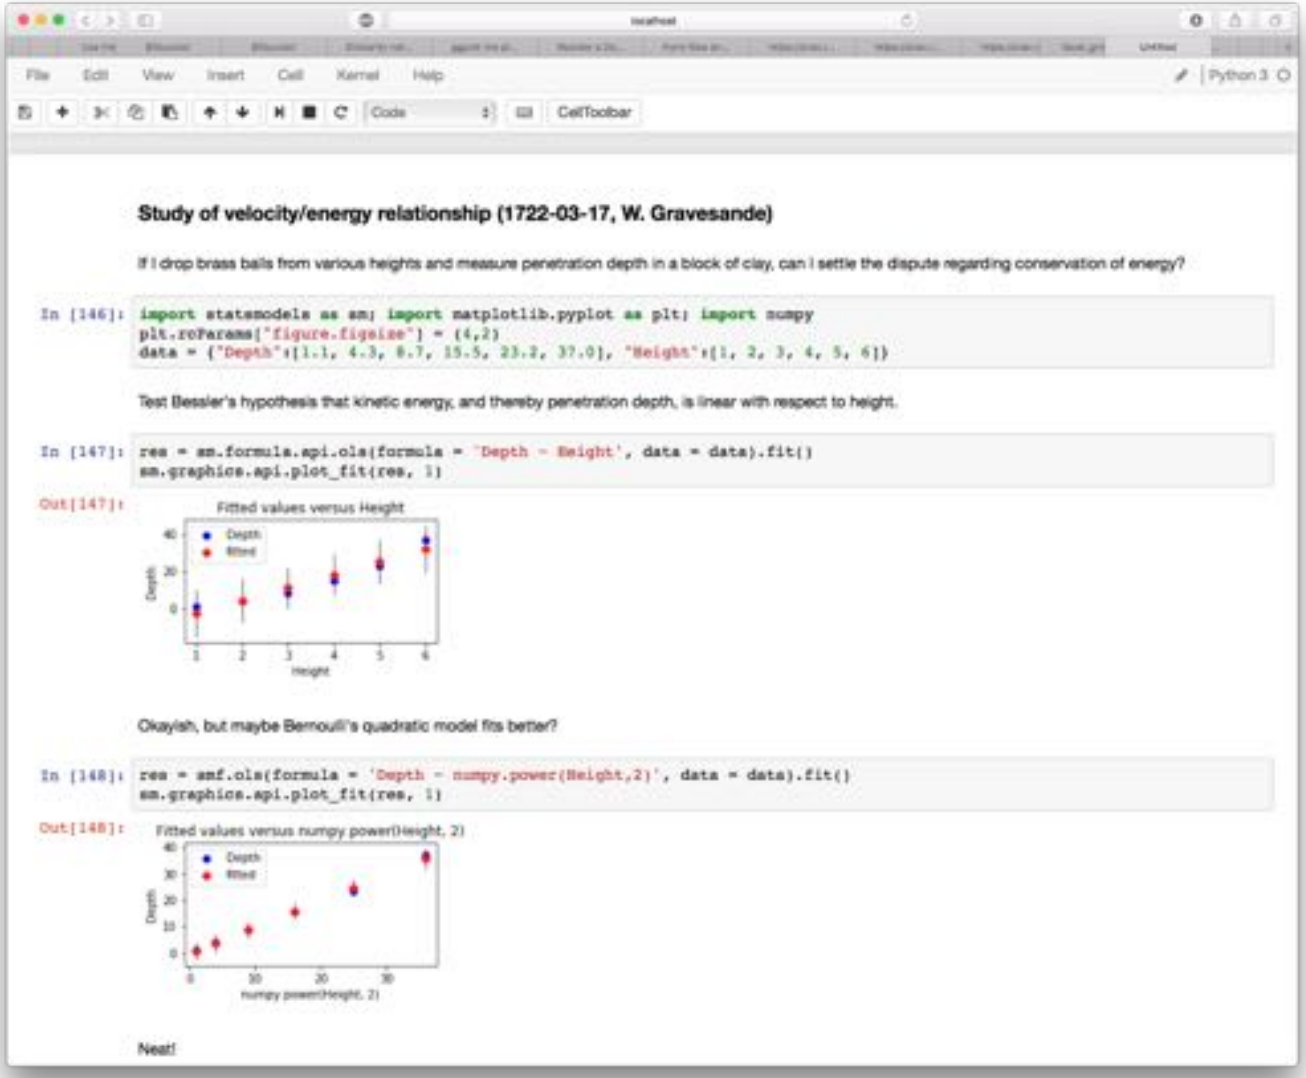
Check which blood biochemistry factors can be used together in linear regression

First load the biochemistry data (this file has been cleaned up and preprocessed by the `bb_pretreatment.Rmd`
script):
```{r, echo=TRUE, message=FALSE, warning=FALSE}
bioch <- read.delim("intermediate/bb_pretreated.tsv", row.names=1, check.names=F)
bioch <- na.omit(bioch)
sampleAnno <- read.delim("intermediate/sample_annotation.tsv", stringsAsFactors=F)
rownames(sampleAnno) <- sampleAnno$Vcode
# Remove subjects that are outliers, has iron deficiency, or without blood biochemistry
# data (also remove secondary anemia and macrocytic anemia subjects when this info is available...)
samplesKeep <- sampleAnno$Vcode[with(sampleAnno, !hasIronDeficiency & !isOutlier &
                                     !hasSecondaryAnemia & !hasMacrocyticAnemia & !is.na(Date))]
bb <- bioch[rownames(bioch)%in%samplesKeep,]

```
```



jupyter



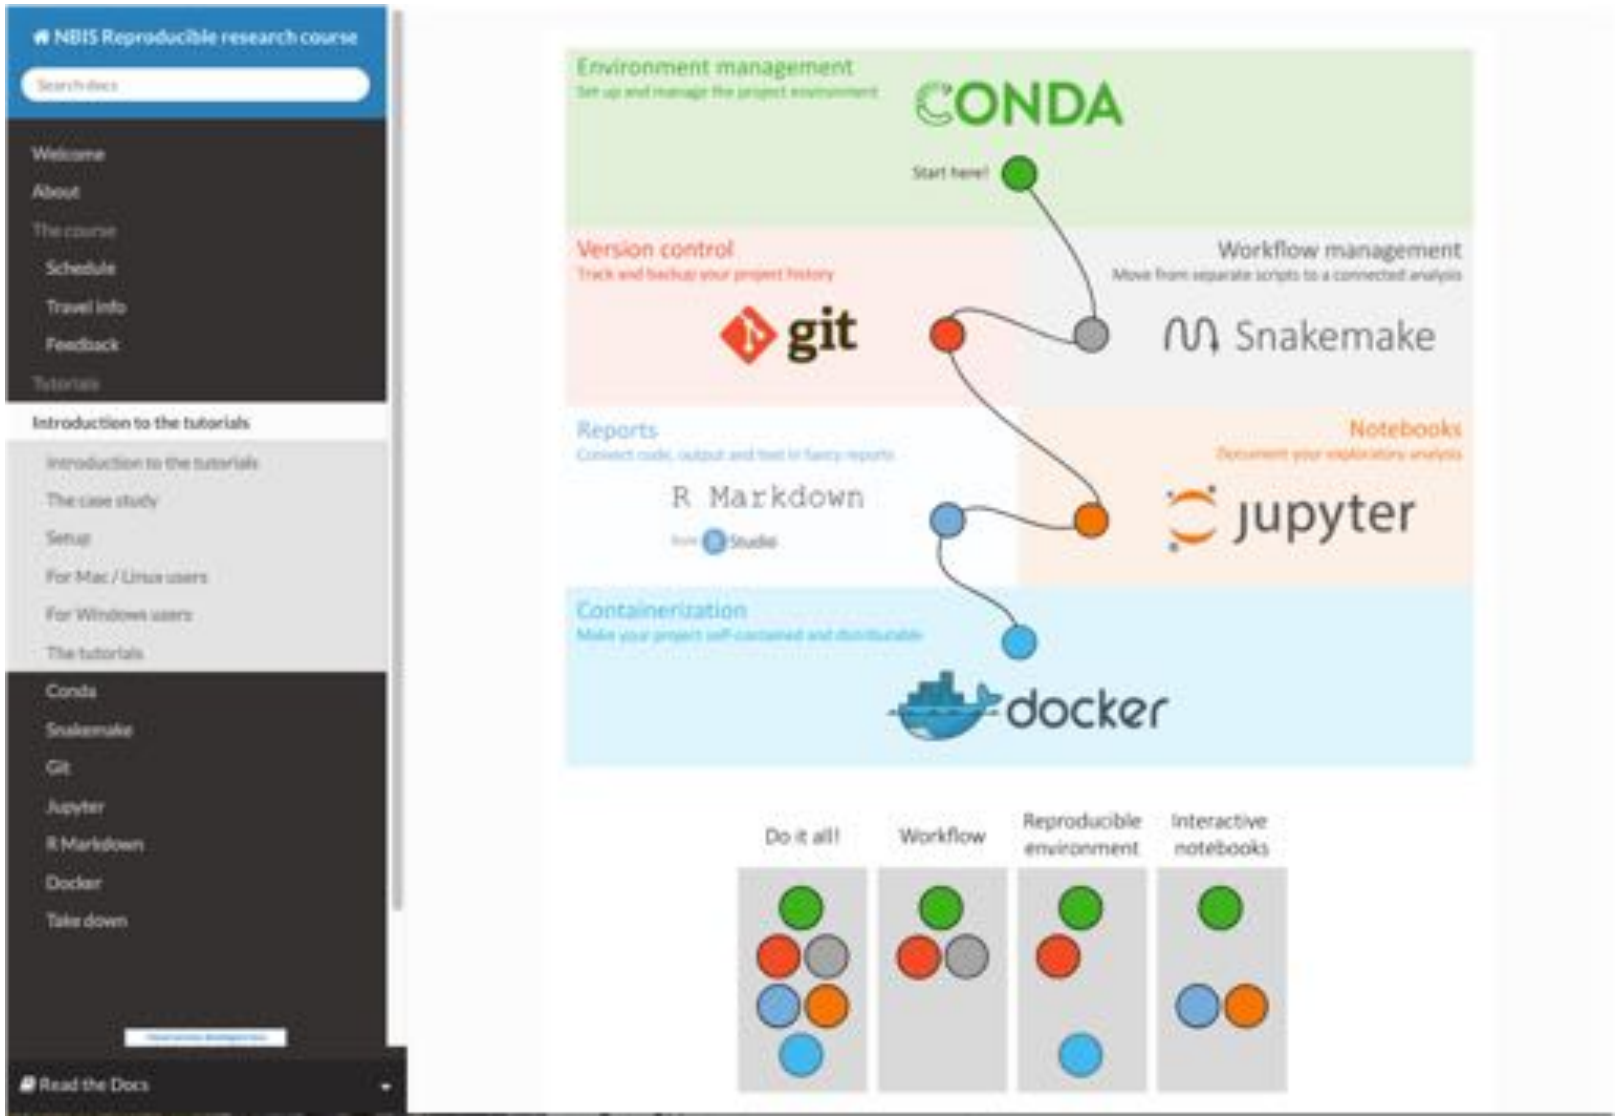
- In-browser editing for code, with automatic syntax highlighting, indentation, and tab completion/introspection.
- The ability to execute code from the browser, with the results of computations attached to the code which generated them.

Project organization

- *There's no perfect set-up*
  - Decide on **a** strategy
  - Example starting points/templates
    - https://github.com/chendaniely/computational-project-cookie-cutter
    - https://github.com/Reproducible-Science-Curriculum/rr-init
    - https://github.com/nylander/ptemplate
- Communicate and discuss structure and ways of working with collaborators
- Document as you go

- Done well it might reduce post-project explaining

Reproducible Research tutorials



https://nbis-reproducible-research.readthedocs.io/en/course_1803/

Project collaboration tools

- Open Science Framework – http://osf.io
  - Organize research project documentation and outputs
  - Control access for collaboration
  - 3rd party integrations
    - Google Drive
    - Dropbox
    - GitHub
    - External links
    - Etc
  - Persistent identifiers
  - Publish article preprints

Personal data

Personal data - Legislation

- GDPR – General Data Protection Regulation (*Dataskyddsförordningen*) + others
- Act concerning the Ethical Review of Research Involving Humans (*Lag om etikprövning av forskning som avser människor*)

GDPR

- All kinds of information that is directly or indirectly referable to a natural person who is alive constitute personal data

- To process personal data:
  - *All processing of personal data must fulfil the **fundamental principles** defined in the Regulation.*
    - Decide a **purpose** and stick to it
    - Only collect data that is needed
    - Don't collect more data than necessary
    - Don't use data for another incompatible purpose
    - Erase data when no longer needed
    - Ensure that data is correct and updated
    - Protect collected data – confidential and intact
    - Identify the **legal basis** for data processing before it starts
    - Inform in a transparent and honest way

Exemptions for some of these possible for research

- The Data Inspection Board (*Datainspektionen*) is the Swedish Data Protection Agency
  - Changing name - *Integritetsskyddsmyndigheten*

GDPR – Legal basis

- **Consent**
- To be able to fulfil contract with data subject
- Legal obligation
- Necessary in order to protect the vital interests of the data subject
- **Public interest**
- Necessary for the purposes of the legitimate interests pursued by the controller

GDPR – Sensitive data

- Special categories (*Sensitive data*)
  - … **racial or ethnic origin**, […] **genetic data**, […], data concerning **health** … Art. 9 (1)
  - Processing is **prohibited** unless…
    - **explicit consent** is given Art. 9 (2)a
    - processing is necessary for **scientific research** in accordance with Article 89(1) based on Union or *Member State law* which shall be proportionate to the aim pursued, respect the essence of the right to data protection and provide for suitable and specific measures to safeguard the fundamental rights and the interests of the data subject. Art. 9 (2)j
    - Member State specific conditions and *limitations possible* for processing of health & genetic data Art. 9 (4)
    - **Sweden**
      - Consent?
      - Public interest → Ethical review necessary (often includes consent)

GDPR – Roles

- The (legal) person that decides why and how personal data should be processed is called the **Controller** (*personuppgiftsansvarig*)
  - e.g. the employing university
  - Controller responsible for
    - Has to ensure the **rights of the individuals**
    - **Take measures** to ensure that the Regulation is followed, and be able to **show** that it is
    - **Privacy by Design** as standard
    - Keep a **register of processing**
    - Apply **security measures** when processing data
    - **Report** personal data **breaches** to the Data Protection Authority
    - Perform *Impact Assessments* and consult Data Protection Authority (when necessary)
    - Appoint **Data Protection Officer**

- The controller of personal data can delegate processing of personal data to a **Processor** (*personuppgiftsbiträde*)
  - e.g. UPPMAX/Uppsala university
  - Joint responsibility with Controller

GDPR – Roles

- A **Data Protection Officer** (*dataskyddssombud*)
  - The natural person that is responsible for ensuring that the organization/company adheres to the GDPR
  - Educate
  - Audit
  - Contact point between organization and Data Protection Agency

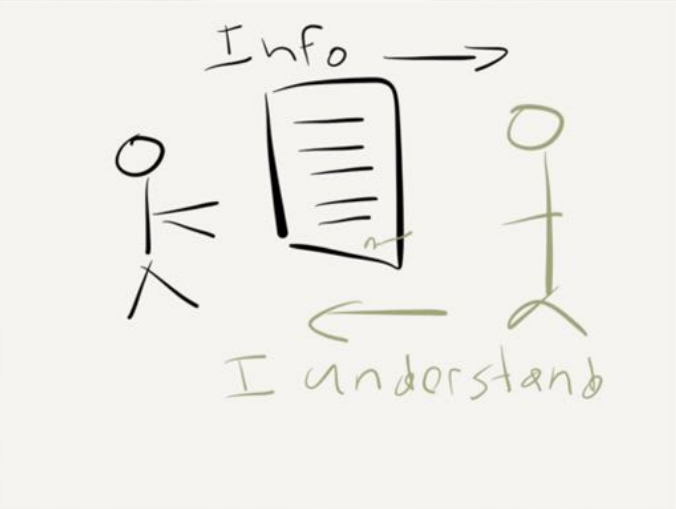
Act concerning the Ethical Review

- Research that concerns studies of biological material that has been taken from a living person and that can be traced back to that person may only be conducted if it has been approved subsequent to an ethical vetting

- Informed consent
  - The subject must be informed about the purpose or the research and the consequences and risks that the research might entail
  - The subject must consent



Genetic information

- The genetic information of an individual is personal data
  - **Sensitive** personal data (as it relates to health)
    - Explicitly defining in GDPR
  - Even if *anonymized / pseudonymized*
  - In principle, **no** difference between WGS, Exome, Transcriptome or GWAS data

- Theoretically possible to identify the individual person from which the sequence was derived from the sequence itself
  - The more associated metadata there is, the easier this gets
  - Gymrek et al. “Identifying Personal Genomes by Surname Inference”. Science 339, 321 (2013); DOI:10.1126/science.1229566

- *Apply technical and organizational measures to protect the sensitive data, e.g.*
  - *Strong IT security and procedures to limit access to data*
  - *Separate from other personal data*
  - *Pseudonymization*
  - *Encryption*.

Comment: The FAIR Guiding Principles for scientific data management and stewardship

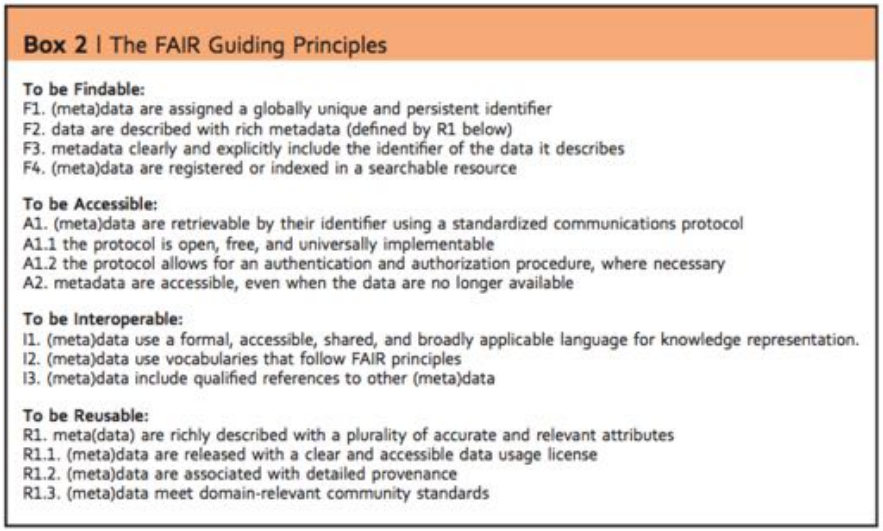
Mark D. Wilkinson *et al.*

There is an urgent need to improve the infrastructure supporting the reuse of scholarly data. A diverse set of stakeholders—representing academia, industry, funding agencies, and scholarly publishers—have come together to design and jointly endorse a concise and measureable set of principles that we refer to as the FAIR Data Principles. The intent is that these may act as a guideline for those wishing to enhance the reusability of their data holdings. Distinct from peer initiatives that focus on the human scholar, the FAIR Principles put specific emphasis on enhancing the ability of machines to automatically find and use the data, in addition to supporting its reuse by individuals. This Comment is the first formal publication of the FAIR Principles, and includes the rationale behind them, and some exemplar implementations in the community.

Supporting discovery through good data management

Good data management is not a goal in itself, but rather is the key conduit leading to knowledge discovery and innovation, and to subsequent data and knowledge integration and reuse by the community after the data publication process. Unfortunately, the existing digital ecosystem surrounding scholarly data publication prevents us from extracting maximum benefit from our research investments (e.g., ref. 1). Partially in response to this, science funders, publishers and

DOI: 10.1038/sdata.2016.18



Box 2 | The FAIR Guiding Principles

To be Findable:
F1. (meta)data are assigned a globally unique and persistent identifier
F2. data are described with rich metadata (defined by R1 below)
F3. metadata clearly and explicitly include the identifier of the data it describes
F4. (meta)data are registered or indexed in a searchable resource

To be Accessible:
A1. (meta)data are retrievable by their identifier using a standardized communications protocol
A1.1 the protocol is open, free, and universally implementable
A1.2 the protocol allows for an authentication and authorization procedure, where necessary
A2. metadata are accessible, even when the data are no longer available

To be Interoperable:
I1. (meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation.
I2. (meta)data use vocabularies that follow FAIR principles
I3. (meta)data include qualified references to other (meta)data

To be Reusable:
R1. meta(data) are richly described with a plurality of accurate and relevant attributes
R1.1. (meta)data are released with a clear and accessible data usage license
R1.2. (meta)data are associated with detailed provenance
R1.3. (meta)data meet domain-relevant community standards

'We support appropriate efforts to promote open science and facilitate appropriate access to publicly funded research results on findable, accessible, interoperable and reusable (FAIR)'

one based on continuous engagement with scientific stakeholders, the European Commissi

PROPOSES that all EOSC stakeholders consider sharing the following intents and
actively support their implementation in the respective capacities:

Data culture and FAIR data

- [**Data culture**] European science must be grounded in a common culture of data stewardshi
that research data is recognised as a significant output of research and is appropriately cu
throughout and after the period conducting the research. Only a considerable cultural change
enable long-term reuse for science and for innovation of data created by research activitie
disciplines, institutions or countries must be left behind.
- [**Open access by-default**] All researchers in Europe must enjoy access to an open-by-def
efficient and cross-disciplinary research data environment supported by FAIR data princi
Open access must be the default setting for all results of publicly funded research in Eu
allowing for proportionate limitations only in duly justified cases of personal data protec
confidentiality, IPR concerns, national security or similar (e.g. 'as open as possible and as cl
as necessary').
- [**Skills**] The necessary skills and education in research data management, data stewardship
data science should be provided throughout the EU as part of higher education, the trai
system and on-the-job best practice in the industry. University associations, rese
organisations, research libraries and other educational brokers play an important role but
need substantial support from the European Commission and the Member States.
- [**Data stewardship**] Researchers need the support of adequately trained data stewards.
European Commission and Member States should invest in the education of data stewards
career programmes delivered by universities, research institutions and other trans-Euro
agents.
- [**Rewards and incentives**] Rewarding research data sharing is essential. Researchers who
research data open and FAIR for reuse and/or reuse and reproduce data should be rewarded,

International public repositories

- Best way to make data **FAIR**
- Domain-specific metadata standards

Consider structuring metadata in the format needed by the repository already at planning stage

ELIXIR Deposition Database list

Deposition Database	Data type	International collaboration framework [1]
ArrayExpress	Functional genomics data. Stores data from high-throughput functional genomics experiments.	
BioModels	Computational models of biological processes.	
EGA	Personally identifiable genetic and phenotypic data resulting from biomedical research projects.	European Bioinformatics Institute and the Centre for Genomic Regulation
ENA	Nucleotide sequence information, covering raw sequencing data, contextual data, sequence assembly information and functional and taxonomic annotation.	International Nucleotide Sequence Database Collaboration
IntAct	IntAct provides a freely available, open source database system and analysis tools for molecular interaction data.	The International Molecular Exchange Consortium
MetaboLights	Metabolite structures and their reference spectra as well as their biological roles, locations and concentrations, and experimental data from metabolic experiments.	

Deposition Database	Data type	International collaboration framework [1]
PDBe	Biological macromolecular structures.	wwPDB
PRIDE	Mass spectrometry-based proteomics data, including peptide and protein expression information (identifications and quantification values) and the supporting mass spectra evidence.	The ProteomeXchange Consortium
Pending incorporation into a Node Service Delivery Plan (see How countries join):		
BioSamples	BioSamples stores and supplies descriptions and metadata about biological samples used in research and development by academia and industry.	NCBI BioSamples database
BioStudies	Descriptions of biological studies, links to data from these studies in other databases, as well as data that do not fit in the structured archives.	
EVA	The European Variation Archive covers genetic variation data from all species.	dbSNP and dbVAR
EMDB	The Electron Microscopy Data Bank is a public repository for electron microscopy density maps of macromolecular complexes and subcellular structures.

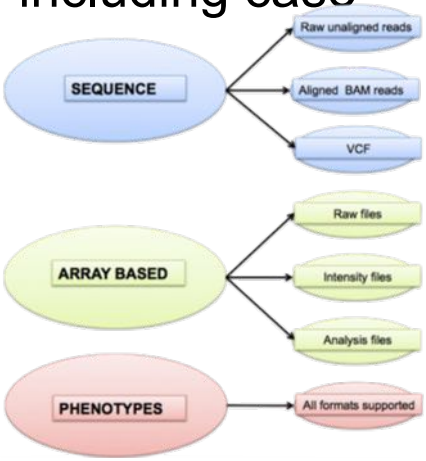
Surprisingly few submit to international repositories

- NIH funded research
  - Only 12% of articles from NIH-funded research mention data deposited in international repositories
  - Estimated 200000+ “invisible” data sets / year

Read et al. “Sizing the Problem of Improving Discovery and Access to NIH-Funded Data: A Preliminary Study” (2015)
PLoS ONE 10(7): e0132735. doi: 10.1371/journal.pone.0132735

What about sensitive data?

- **EGA** – European Genome-phenome Archive
  - Repository that promotes the distribution and sharing of **genetic and phenotypic data** consented for specific approved uses but **not fully open, public distribution**.
  - All types of sequence and genotype experiments, including case-control, population, and family studies.



- Data Access Agreement
  - Defined by the data owner
- Data Access Committee – DAC
  - Decided by the data owner

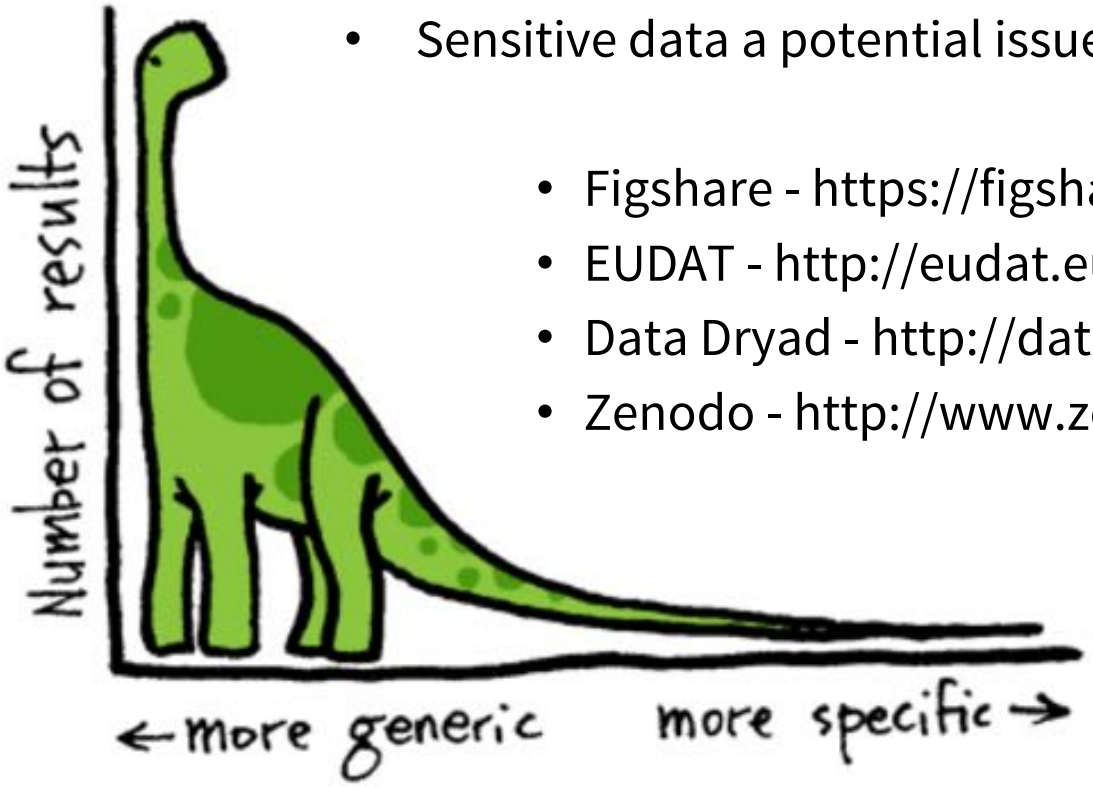
“Long-tail data” repositories

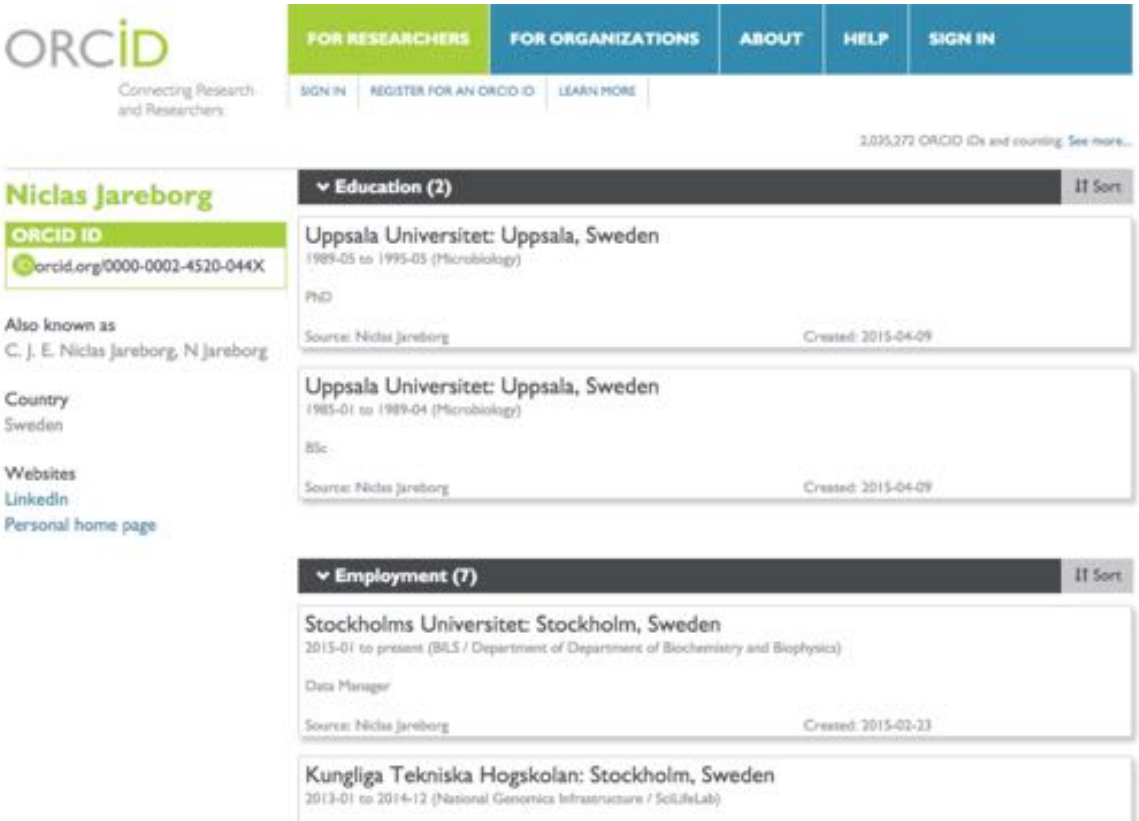
- Research data that doesn’t fit in structured data repositories
- Data publication – persistent identifiers
- Metadata submission – not tailored to Life Science
  - *Affects discoverability*
  - *(Less) FAIR*
- Sensitive data a potential issue



- Figshare - https://figshare.com/
- EUDAT - http://eudat.eu/
- Data Dryad - http://datadryad.org/
- Zenodo - http://www.zenodo.org/

Persistent identifier for yourself

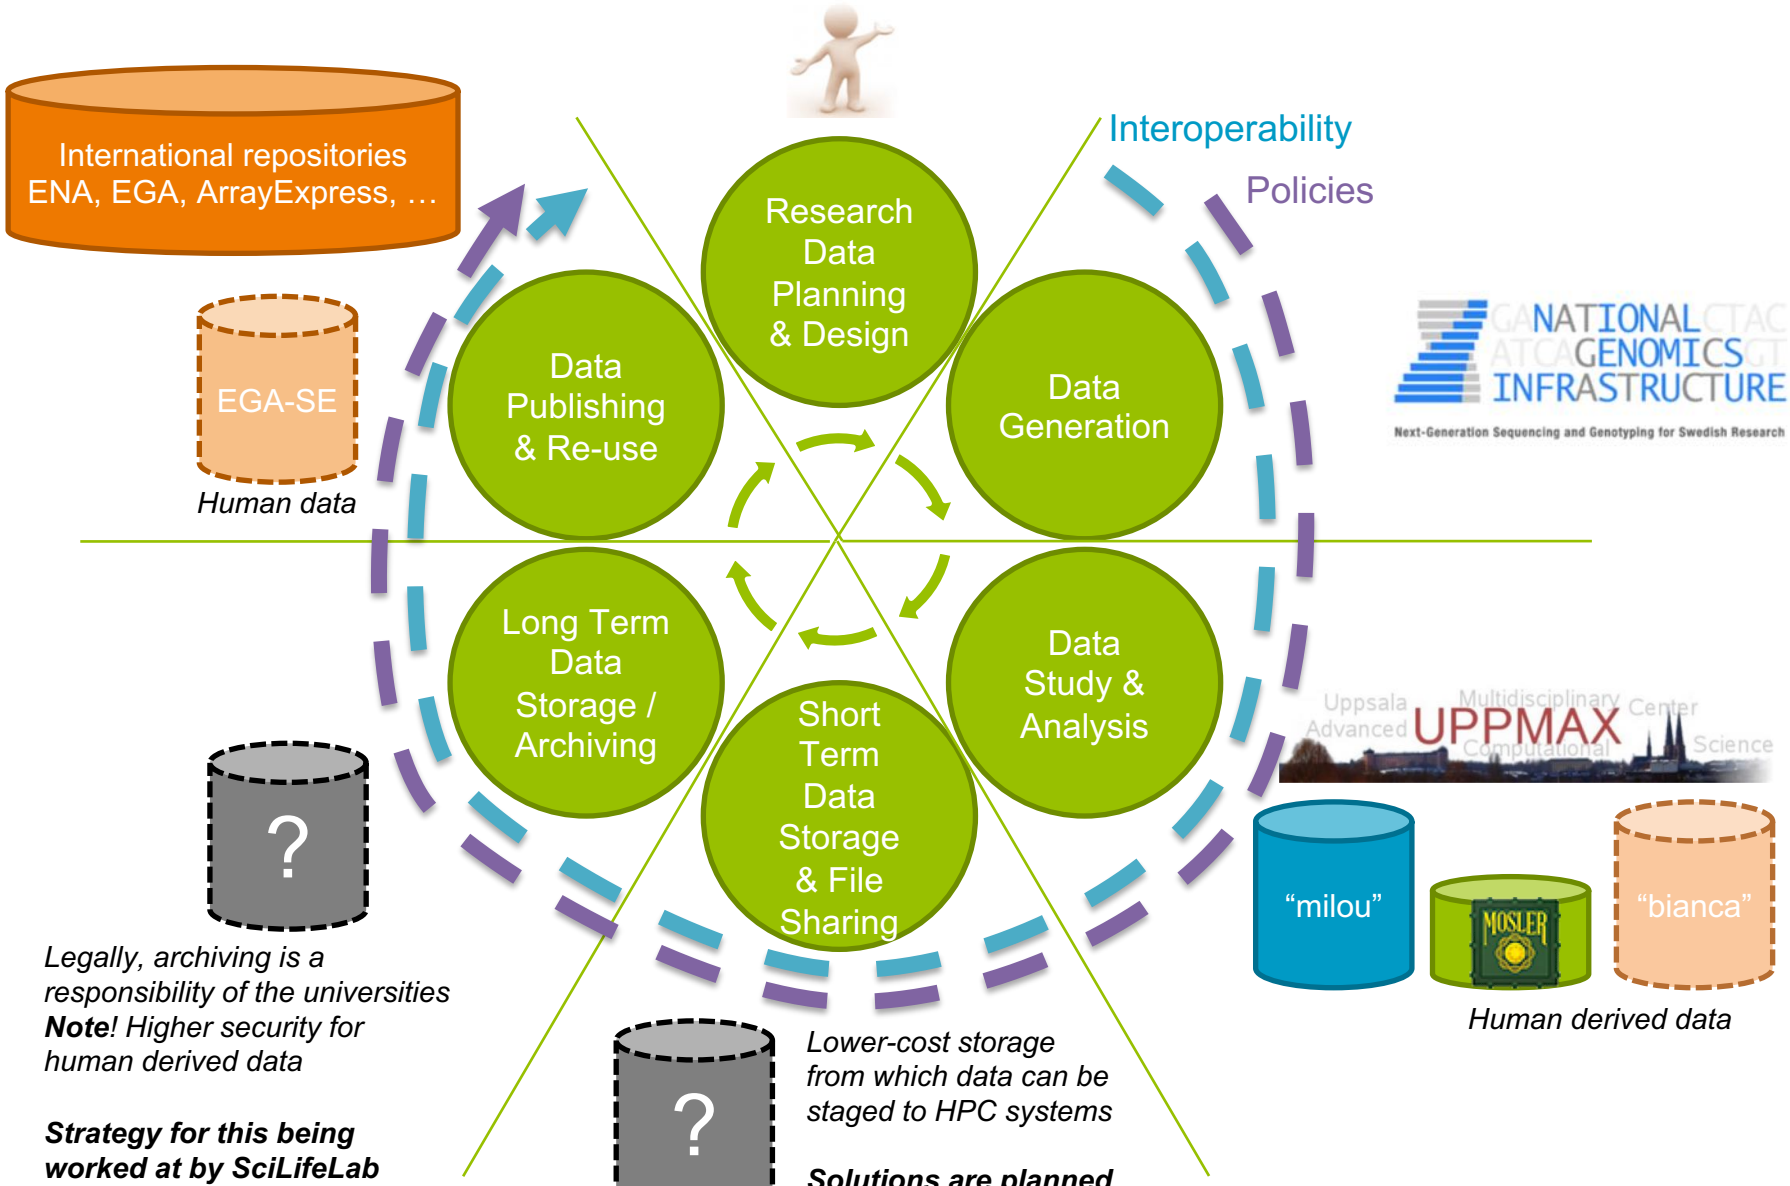
- ORCID is an open, non-profit, community-driven effort to create and maintain a registry of unique researcher identifiers and a transparent method of linking research activities and outputs to these identifiers.
- http://orcid.org
- Persistent identifier for you as a researcher



NBIS Data Management support

- Project planning
  - Metadata
  - File formats
  - Licensing
  - *Data Management Plans*
- Data analysis
- Data publication and submission
  - Support submissions to public repositories
  - Metadata
  - DOIs to dataset (if needed)

Gaps in the NGS Data Life Cycle



NBIS
NATIONAL BIOINFORMATICS INFRASTRUCTURE SWEDEN

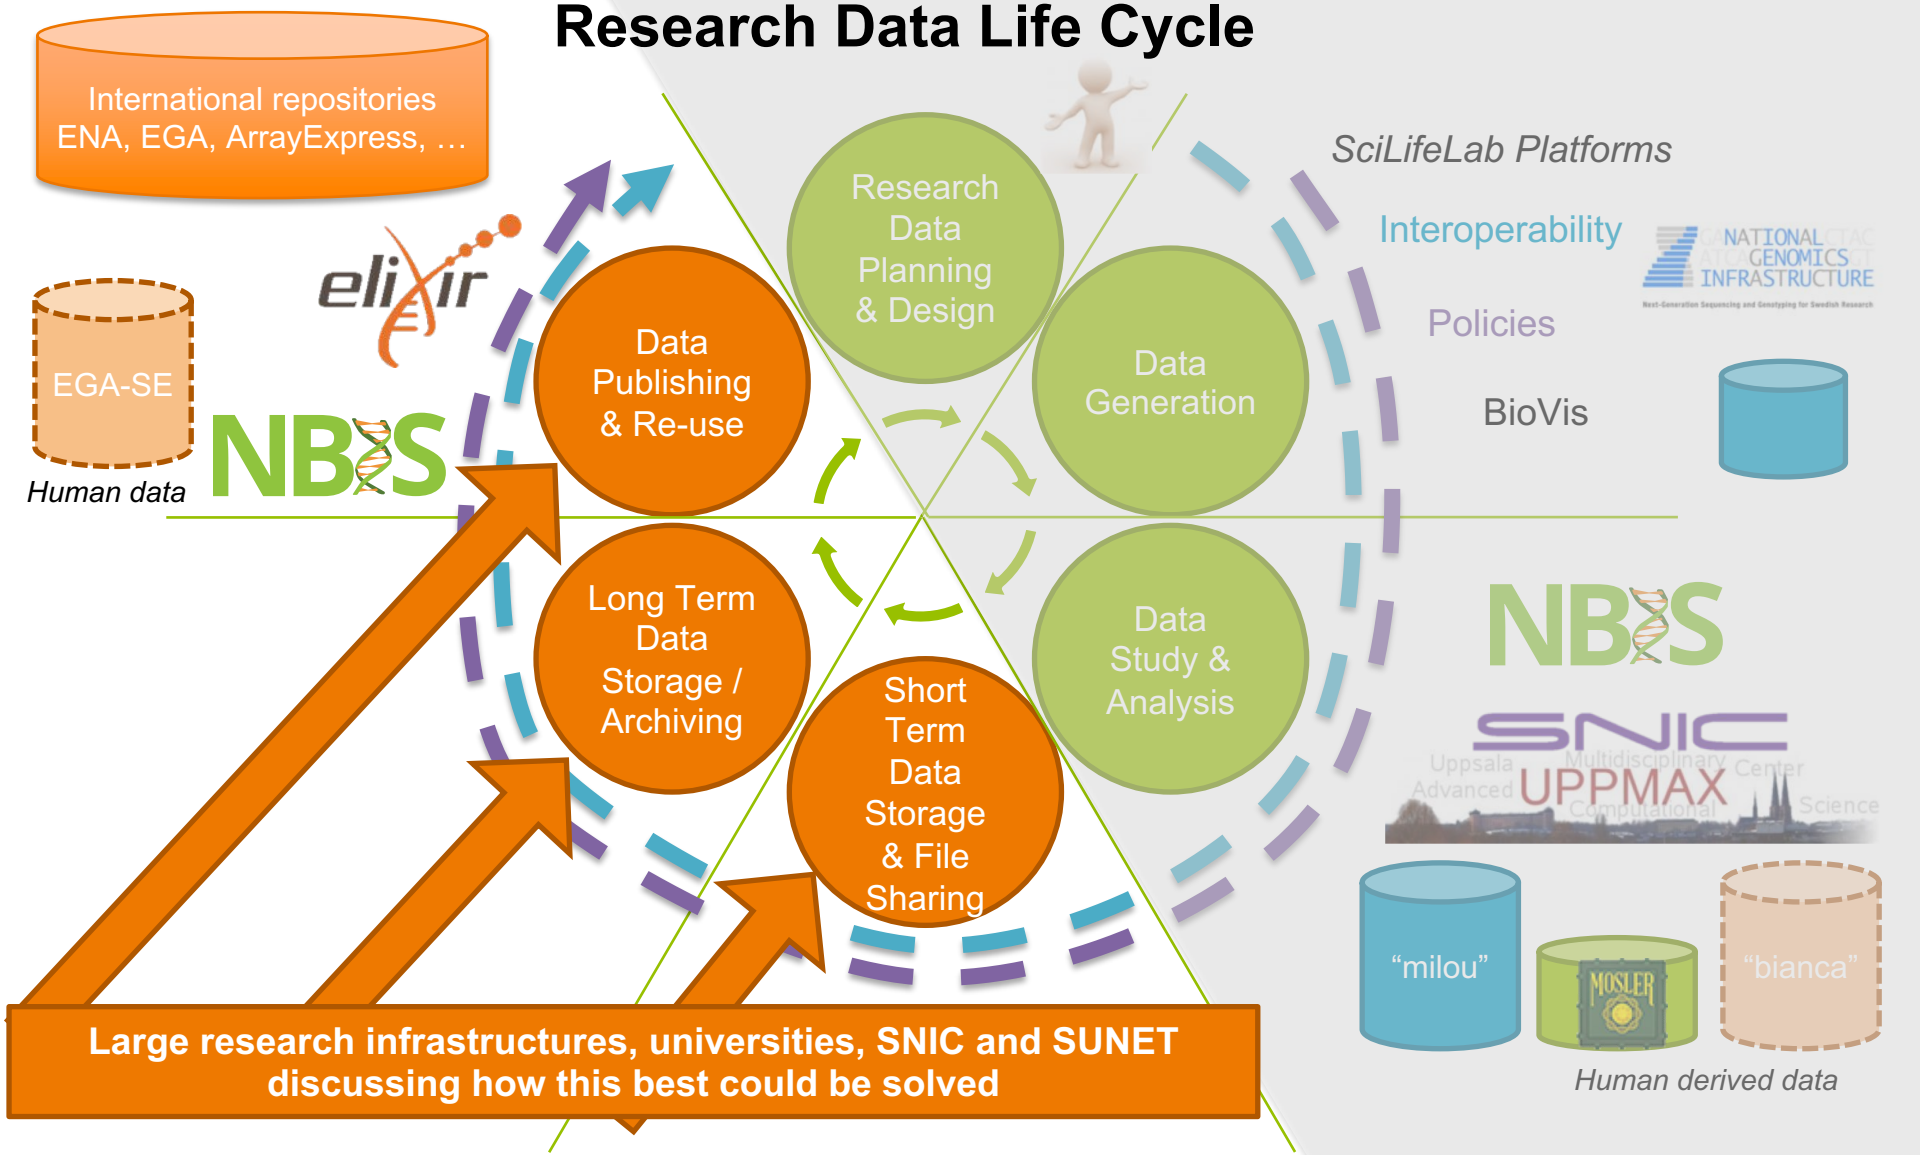
Research Data Life Cycle



Take home messages

- Consider doing a Data Management Plan for your project
  - How do you ensure that your research output is FAIR?
- Plan for submitting ”raw data” to public repositories as early as possible
- Organize project metadata from the start
  - In ways that makes it easy to submit to public repositories
  - Use available standards
- Pick a thought-through file and folder structure organization for your computational analyses
- Strive for reproducibility
  - Data & Code
- Be aware that there are legal aspects to processing human data
- *Ask for help if you need it!*
